VHF propagation should remain mostly normal throughout the next six months, with decreased probabilities of DX contacts in December and January. Reduced MUF will also make DX openings on 50 MHz somewhat unlikely during these months of expected decreased solar activity. Although reduced MUF's are anticipated, there remains a moderate probability for some potential auroral backscatter communications on VHF bands during periods of minor to major geomagnetic and auroral storming. Middle and high latitudes will benefit the most during these periods.

RECENT SOLAR INDICES (PRELIMINARY) OF THE OBSERVED MONTHLY MEAN VALUES

22 Oct	0611 0641 0740	M2.9	SF S08W50 6322		1+		

NOTES:

- Xray Flare Classes (weak to strong): C, M, X (with sub-categories rated from 0.0 to 9.9 in each class).

- Optical Flare Classes (weak to strong): S, 1, 2, 3, 4 (with an attached figure identifying brightness: F-Faint, N-Normal, B-Brilliant).

- Locations are given in latitude and longitude as measured from the central solar meridian.

- Sweep Frequency Intensity represents the intensity of detected solar radio frequency bursts (bursts sweep over large frequencies). Type II and IV almost always represent ejection of solar material through the solar corona and into interplanetary space. Intensities are rated from 1 to 3+.

>You might be aware that Glen's WORLD OF RADIO has aired for many years
>over WRNO, the one time powerhouse gone flea power. With the WRNO
>signal now more of a JOKE than a broadcast service, Hauser has made the
>right move.

Maybe. I didn't read this posting until 0210 UTC Monday. At my QTH WRNO
was putting in a fine signal (4 out of 5) while WWCR was buried underneath
some terrible interference--the nature of which I could not determine.
The QRM was so terrible I couldn't make out anything being said. This
was true on both the FRG-8800 hooked up to the outdoor antenna and the
ICF 2010 on the telescoping antenna.

Did anybody else hear this?

Does this mean Hauser will no longer be heard on WRNO where his show aired
a number of times a week? (My favorite daily double IS on Thursday night
local time where his program aired on WRNO at 0130 UTC Friday immediately after
Radio Nederland's Media Network.)

Date: Sun, 25 Nov 90 14:38:43 edt
From: "Gray, Steven" <GRAY_S%DICKINSN.BITNET@CUNYVM.CUNY.EDU>
Subject: FOR SALE: Shure 444D and Hustler 4-BTV
To: INFO-HAMS@UCSD.EDU

I've got the following items for sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a
tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

BTW, the reason for the sale is that it appears I will be spending a good deal
of time away from home over the next 2 years. Anybody know of a *hot* 10
meter mag-mount antenna? Doesn't Wilson make something that works well?

Thanks for reading!

In response to an article by Bob Hlivak:

Gordon West is a respected individual who happens to make a living preparing people to take amateur radio exams. His course material is available in radio stores (including Radio Shack) and through mail order.

He's done a lot to get more hams into the ranks. I owe my license to his study materials. What he's doing is both legal and ethical. I fail to understand the nature of your outrage.

SB RTTYDX @ RTTYDX $RTDX1123
RTTY DX Notes 1of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123
Part 1 of 3.

One wonders where the art of communications has gone to? Over the past week I have been looking at the mini mailboxes. I Saw 43 of them. Are they all small sized PK232s? It seems that with the proliferation of these units it will soon be impossible to find a space to have a QSO. I think that an original idea that was put forward would be a viable answer. All mailboxes (including mini mailboxes) be shifted to 10 and 18 MHz. That would be a logical answer. Use those frequencies, or lose them.

Our thanks this week go to DJ3IW and the Saar-Pfalz-DX-Club Packet Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, N2HOS, OD5NG, TG9VT, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your very welcome information and help.

RTTY DX Notes 3of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123B
Part 3 of 3.

QSL Information:

UC2OCJ says to QSL via Box 68, Gomel. 246027 Buelrussia, USSR.

9X5LJ and 9X5AB request their cards be sent to Box 81, Kigali, Rwanda.

UH8EA collects his cards from W5BWA.

5N0ETP collects his cards via N6LQL.

9Q5TE has SM0BFJ as his QSL manager.

CE0ZZZ says to QSL to Box 13312 Santiago, Chile.

Notes of Interest:

JA3DLE/1 reports that JG1RVN will be QRV from XU for 6 days from 3rd to 9th December with lots of RTTY.

On 27th November, or around that date, (after the CW contest), N7NG, OH2BH, OH2RF, and ZS6BCR will operate from Penguin Island (off the coast of Namibia) for 6 days by special permission of the South African Nature and Conservation people. The callsign could be ZS9Z/ZS1, after which they will operate from Walvis Bay with the callsign of ZS9Z for 4 days. They will use Icom gear and the QSLS go to OH2BH.

3W3RR is still hopeful of operating from Spratley in December.

Kure Island (KH7) is scheduled for December 12-21, all bands including 6 meters, if they can find some gear and aerials for 6. If you can help, call 671-346-2201 (in Guam) after 0600Z. Prefixes may be KH7/AH7/WH7 for the prefix hunters. The basic callsign will be KD7P/NH7.

SP5FYM is headed for King George Island (Antarctica) for January 1991.

There is a plan to activate 'MV' Island (in the Gulf of Finland) in March 1991. They require RTTY gear. More later.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Are you reading this from a packet BBS in Utah, Colorado, Kansas, Missouri, Kentucky, Tennessee or Georgia? Send a message noting the station originating this bulletin to KT7H @ N7HFZ.WA.USA.NA.

Subject: SOLAR TERRESTRIAL FORECAST AND REVIEW
To: info-hams@ucsd.edu

/\/\/\

Please Note:

A few modifications have been made to these reports. In addition to the new 20-day solar flux forecasts, new prediction charts have been added for potential VHF DX propagation. Included with the VHF DX propagation prediction charts are SID and auroral backscatter enhancement predictions charts. Comments regarding the inclusion/removal of these new features are welcomed. In order to keep the size of these reports down, some of the extraneous information has been removed.

An informational document is being prepared to aid those who are interested in understanding and using these reports in practical applications. To obtain this file, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

/\/\/\

Region 6377 (S04W01) has developed rapidly over the past 24 hours and managed to produce a healthy class M3.1/1B Tenflare at 14:25 UT on 24 November. Other minor discrete radio emissions were observed from this flare. The location of this flare was at S04E04. It lasted 57 minutes, ending at 15:09 UT on 24 November. Region 6368 also managed to produce a class M1.2/SF flare at 23:46 UT on 24 November. Both of these flares produced a SID/SWF.

Geomagnetic activity was unexpectedly low this week. Activity was predicted to be unsettled to active, but maintained almost exclusively quiet conditions throughout the week. Effects from a coronal hole never materialized. As well, predicted solar activity never reached anticipated levels and thus did not produce expected terrestrial impacts.

Auroral activity likewise did not reach anticipated levels. Auroral activity was not visible at middle and low latitudes. Some higher latitudes spotted moderate auroral activity on 18 November, but activity dwindled as the week progressed.

Radio propagation conditions were normal to above normal this week. Relatively strong and stable signals occurred throughout the week at low and middle latitudes due to the unexpectedly quiet geomagnetic and auroral activity. Some increased levels of noise were evident on 18 November due to subsiding geomagnetic activity over higher latitudes. There were numerous short wave fades (SWFs) throughout the week, all attributed to the M-class flare activity from Region 6368. None of the SWF's were intense. The majority of frequencies affected were below 10 MHz. It is not known whether the SWF's were accompanied by VHF enhancements. Ionization levels were likely not high enough to produce any significant VHF signal enhancements, although there were probably localized area's of enhanced sporadic E during these periods.

As of 25 November, two additional SID/SWF's were observed. The first began at 14:12 UT and ended at 15:05 UT on 24 November. The second began at 23:30 UT and ended at 00:31 UT on 25 November. Both of these events were of low to moderate intensity and were flare-related.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low with the possibility for occassional M-class flaring from departing Region 6368 and Region 6377. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA and proton events. Region 6368 continues to sport a Beta-Gamma-Delta magnetic configuration with particular delta complexity in the trailer spot group. Probability for a major class X flare is stationary at 10% over the next two days, dropping to 5% on 27 November with the passage of Region 6368 beyond the west limb. There is a 5% probability of a major proton flare from this region. Although these probabilities are low, they warrant attention. The solar flux is expected to drop quite dramatically with the passage of Region 6368 beyond the west limb on 26 and 27 November.

Geomagnetic activity is expected to remain mostly quiet until 26 November when models suggest activity should increase to unsettled levels over all latitudes with a risk of active periods over middle and high

latitude regions. No significant activity or storming is expected, however. Conditions should return to quiet to unsettled levels by 28 November.

Auroral activity will be dormant until near 26 November when some increase in activity may occur. Activity will remain confined to the high latitude regions where it is expected to be mostly of low intensity with possible bursts of moderate activity. Auroral activity is then expected to decline to non-visible levels on 27/28 November and remain quiet throughout the remainder of the week.

HF radio propagation conditions should be quite good this week, with only a slight increase in noise and flutter expected near 26/27 November. The expected increase in geomagnetic and auroral activity should not have much of an impact on HF radio communications. So with the exception of 26 and 27 November, HF communications should be above normal on most of the other days this week. Sporadic degraded HF propagation is possible on the sunlit side of the earth due to expected persisting SIDs/SWFs caused by minor solar flaring.

VHF radio propagation should remain normal this week. There is the potential for sporadic DX contacts during SID periods which are expected to occur on the sunlit hemisphere of the earth this week due to minor flaring from departing Region 6368 and Region 6377. Other than these slight possibilities, conditions will not be sufficient to provide widespread DX opportunities this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 25 NOVEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6368	N18W65	025	5460	FKI	23	045	BETA-GAMMA-DELTA
6372	S18W27	347	0120	HAX	02	002	ALPHA

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

Subject: FOR SALE: Shure 444D and Hustler 4-BTV
To: INFO-HAMS@UCSD.EDU

I've got the following items for sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a
tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

BTW, the reason for the sale is that it appears I will be spending a good deal
of time away from home over the next 2 years. Anybody know of a *hot* 10

meter mag-mount antenna? Doesn't Wilson make something that works well?

Thanks for reading!

In response to an article by Bob Hlivak:

Gordon West is a respected individual who happens to make a living preparing
people to take amateur radio exams. His course material is available in radio
stores (including Radio Shack) and through mail order.

He's done a lot to get more hams into the ranks. I owe my license to his
study materials. What he's doing is both legal and ethical. I fail to
understand the nature of your outrage.

SB RTTYDX @ RTTYDX $RTDX1123
RTTY DX Notes 1of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123
Part 1 of 3.

One wonders where the art of communications has gone to? Over the past week I have been looking at the mini mailboxes. I Saw 43 of them. Are they all small sized PK232s? It seems that with the proliferation of these units it will soon be impossible to find a space to have a QSO. I think that an original idea that was put forward would be a viable answer. All mailboxes (including mini mailboxes) be shifted to 10 and 18 MHz. That would be a logical answer. Use those frequencies, or lose them.

Our thanks this week go to DJ3IW and the Saar-Pfalz-DX-Club Packet Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, N2HOS, OD5NG, TG9VT, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your very welcome information and help.

RTTY DX Notes 3of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123B
Part 3 of 3.

QSL Information:

UC2OCJ says to QSL via Box 68, Gomel. 246027 Buelrussia, USSR.

9X5LJ and 9X5AB request their cards be sent to Box 81, Kigali, Rwanda.

UH8EA collects his cards from W5BWA.

5N0ETP collects his cards via N6LQL.

9Q5TE has SM0BFJ as his QSL manager.

CE0ZZZ says to QSL to Box 13312 Santiago, Chile.

Notes of Interest:

JA3DLE/1 reports that JG1RVN will be QRV from XU for 6 days from 3rd to 9th December with lots of RTTY.

On 27th November, or around that date, (after the CW contest), N7NG, OH2BH, OH2RF, and ZS6BCR will operate from Penguin Island (off the coast of Namibia) for 6 days by special permission of the South African Nature and Conservation people. The callsign could be ZS9Z/ZS1, after which they will operate from Walvis Bay with the callsign of ZS9Z for 4 days. They will use Icom gear and the QSLS go to OH2BH.

3W3RR is still hopeful of operating from Spratley in December.

Kure Island (KH7) is scheduled for December 12-21, all bands including 6 meters, if they can find some gear and aerials for 6. If you can help, call 671-346-2201 (in Guam) after 0600Z. Prefixes may be KH7/AH7/WH7 for the prefix hunters. The basic callsign will be KD7P/NH7.

SP5FYM is headed for King George Island (Antarctica) for January 1991.

There is a plan to activate 'MV' Island (in the Gulf of Finland) in March 1991. They require RTTY gear. More later.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Are you reading this from a packet BBS in Utah, Colorado, Kansas, Missouri, Kentucky, Tennessee or Georgia? Send a message noting the station originating this bulletin to KT7H @ N7HFZ.WA.USA.NA.

/\/\/\

potential developement of major flare activity.

Region 6368 showed signs of decay on 20 November although it continued to produce a healthy barrage of C-class and occassional M-class flares. The largest flare from this region was a class M3.5/1N at 09:54 UT on 19 November. This region was believed responsible for producing a Type II sweep between 13:46 UT and 13:49 UT on 18 November. The estimated shock velocity was 1,000 km/sec. No terrestrial impacts occurred from this event.

Region 6368 has continued a very gradual decay since 20 November, maintaining a complex delta configuration in the trailing spot group. It has also continued frequent subflaring with modest amounts of C-class flaring. M-class flares have dropped in frequency since 20 November.

Region 6377 (S04W01) has developed rapidly over the past 24 hours and managed to produce a healthy class M3.1/1B Tenflare at 14:25 UT on 24 November. Other minor discrete radio emissions were observed from this flare. The location of this flare was at S04E04. It lasted 57 minutes, ending at 15:09 UT on 24 November. Region 6368 also managed to produce a class M1.2/SF flare at 23:46 UT on 24 November. Both of these flares produced a SID/SWF.

Geomagnetic activity was unexpectedly low this week. Activity was predicted to be unsettled to active, but maintained almost exclusively quiet conditions throughout the week. Effects from a coronal hole never materialized. As well, predicted solar activity never reached anticipated levels and thus did not produce expected terrestrial impacts.

Auroral activity likewise did not reach anticipated levels. Auroral activity was not visible at middle and low latitudes. Some higher latitudes spotted moderate auroral activity on 18 November, but activity dwindled as the week progressed.

Radio propagation conditions were normal to above normal this week. Relatively strong and stable signals occurred throughout the week at low and middle latitudes due to the unexpectedly quiet geomagnetic and auroral activity. Some increased levels of noise were evident on 18 November due to subsiding geomagnetic activity over higher latitudes. There were numerous short wave fades (SWFs) throughout the week, all attributed to the M-class flare activity from Region 6368. None of the SWF's were intense. The majority of frequencies affected were below 10 MHz. It is not known whether the SWF's were accompanied by VHF enhancements. Ionization levels were likely not high enough to produce any significant VHF signal enhancements, although there were probably localized area's of enhanced sporadic E during these periods.

As of 25 November, two additional SID/SWF's were observed. The first began at 14:12 UT and ended at 15:05 UT on 24 November. The second began at 23:30 UT and ended at 00:31 UT on 25 November. Both of these events were of low to moderate intensity and were flare-related.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low with the possibility for occassional M-class flaring from departing Region 6368 and Region 6377. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA and proton events. Region 6368 continues to sport a Beta-Gamma-Delta magnetic configuration with particular delta complexity in the trailer spot group. Probability for a major class X flare is stationary at 10% over the next two days, dropping to 5% on 27 November with the passage of Region 6368 beyond the west limb. There is a 5% probability of a major proton flare from this region. Although these probabilities are low, they warrant attention. The solar flux is expected to drop quite dramatically with the passage of Region 6368 beyond the west limb on 26 and 27 November.

Geomagnetic activity is expected to remain mostly quiet until 26 November when models suggest activity should increase to unsettled levels over all latitudes with a risk of active periods over middle and high latitude regions. No significant activity or storming is expected, however. Conditions should return to quiet to unsettled levels by 28 November.

Auroral activity will be dormant until near 26 November when some increase in activity may occur. Activity will remain confined to the high latitude regions where it is expected to be mostly of low intensity with possible bursts of moderate activity. Auroral activity is then expected to decline to non-visible levels on 27/28 November and remain quiet throughout the remainder of the week.

HF radio propagation conditions should be quite good this week, with only a slight increase in noise and flutter expected near 26/27 November. The expected increase in geomagnetic and auroral activity should not have much of an impact on HF radio communications. So with the exception of 26 and 27 November, HF communications should be above normal on most of the other days this week. Sporadic degraded HF propagation is possible on the sunlit side of the earth due to expected persisting SIDs/SWFs caused by minor solar flaring.

VHF radio propagation should remain normal this week. There is the potential for sporadic DX contacts during SID periods which are expected to occur on the sunlit hemisphere of the earth this week due to minor flaring from departing Region 6368 and Region 6377. Other than these slight possibilities, conditions will not be sufficient to provide widespread DX opportunities this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 25 NOVEMBER

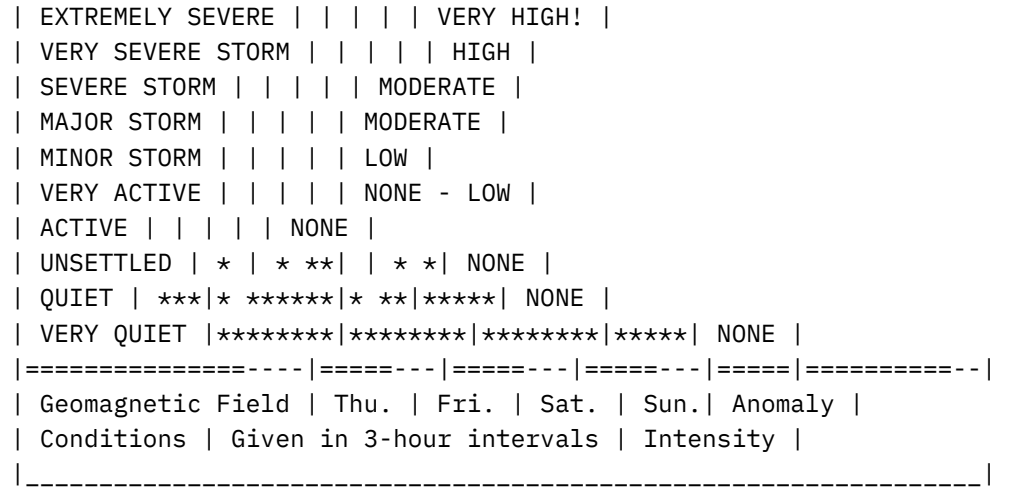
GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours



NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

Cumulative 60 day Solar Activity Record
Start Date: September 27, 1990

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be

expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

3391. Request for information on the SARSAT satellites

Newsgroup: rec.ham-radio
Date: 1990-11-26 10:29:46 UTC
From: n2aam@kb2ear.UUCP
Message-ID: <673@kb2ear.UUCP>
Source record: 6329
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.space

I am looking for any information about the SARSAT search and rescue satellites. I know that they are low orbiting birds that listen to 121.5 and 243.0mhz. They are listening for elt signals. I know that they, with a ground station can pinpoint downed aircraft by listening to the elt. What is the downlink frequency used by SARSAT? What form of modulation does it use? Is any onboard data processing taking place on the birds? If so what kind? What kind of equipment is used at the ground stations? What type of signals do the birds send to the ground? Are they the output of the rcprs listening on 121.5 and 243.0? Or is it sum kind of data from an onboard computer? Any information would be appreciated.

Dave Marthouse

3392. Ham Stacks compacter

Newsgroup: rec.ham-radio
Date: 1990-11-26 12:19:43 UTC
From: dls@genrad.com
Message-ID: <39808@genrad.UUCP>
Source record: 6394

Hi, Guys!

The good news is that the ham stacks are now available on apple.com via ftp. The bad news is that I've gotten two requests why they can't be unpacked using StuffIt. Hopefully to reduce the amount of email, I'll make this an article instead.

The reason why these ham stacks can't be unpacked with StuffIt is because they were never PACKED by StuffIt. StuffIt doesn't do a good enough job to allow all five Ham Stacks on a single 800K diskette. I used a compressor called Diamond4.2, which is included on all diskettes that I send out (including the one I sent to the people at apple.com). Hopefully, they either unpacked them before putting them on the computer, or they included the Diamond4.2 compactor on the computer as well. Go back and check for the Diamond4.2 compactor program.

Hope this helps.

3393. Radar detectors in Virginia

Newsgroup: rec.ham-radio
Date: 1990-11-26 13:26:29 UTC
From: KENDALLG@VTVM1.CC.VT.EDU
Message-ID: <9011261335.AA21581@ucsd.edu>
Source record: 6395

In a recent digest, Mark Eakin asked:

| As long as this is still the place for legal RF questions, I've have one:
|
| I seem to remember that radar detectors are illegal in Virginia, a friend says
| its Maryland. Does anyone know? I hope we're not both right, I'm moving up
| there soon.
| --

I can't say about Maryland, but in Virginia it is *ILLEGAL* to operate a radar detector in your vehicle. If you're stopped by an officer/trooper/deputy and you have one hooked up *OR* if the unit is accessible to the driver from inside the vehicle (like laying on your seat, even if it's disconnected) then you're fair game for a ticket. If it's locked up in your trunk where you can't get at it while driving then you're safe.

Years ago they would actually confiscate the device; I don't think that's done now.

Very interesting: then what was that bright orange spot I've seen recently from Germany? If NASA wants to go to Mars, and if it wants to go alone, it's o.k. - but do they then have to restrict its visibility :-) ?

Except for Antarctica, of course, Mars is visible these days at 8 p.m. local time around the globe.

3395. Gordon West

Newsgroup: rec.ham-radio

From: sehrlich@lynx.northeastern.edu
Message-ID: <memo.579111@lynx.northeastern.edu>
Source record: 6397

Hi again. I finally received my Novice call in the mail a few weeks ago! KA1WNU/KT. I was able to upgrade from Novice to Technician in just 3 days with the help of Gordon West's Technician guide from Radio Shack. His material was excellent. My question is: Does anyone know if Gordon West has any study guides for license classes higher than General? I am presently studying his General class book, and would be very disapointed if this was his highest level book.

Any help out there?

3397. NASA element sets available for FTP

Newsgroup: rec.ham-radio
Date: 1990-11-26 14:50:39 UTC
From: elmquist@nachos.SSESCO.com
Message-ID: <265@nachos.SSESCO.com>
Source record: 6399
Cross-posted to: sci.space,rec.ham-radio

We have set up a directory on one of our machines for anonymous FTP'ing
of T.S. Kelso's NASA element sets. Dr. Kelso is mailing them directly
to me as well as posting them to various newsgroups. I will make them
immediately available for anonymous FTP once I receive them. The
current and the previous versions will be available.

The element sets are available from:

nachos.ssesco.com [192.55.187.18]

in the directory:

nasa_elements

The filenames are of the form:

nasaXXX

where 'XXX' is the element set number as released by Dr. Kelso.

Problems with FTPing? Address them to: elmquist@ssesco.com

Does anyone know who I should contact regarding the possible purchase of some of Boston University's Amateur Radio Club equipment? I have heard that their club has gone under, and that they are (were) looking for buyers of their equipment. If anyone knows anything about this (or if my information is completely wrong), please e-mail me.

Thanks much,

Scott (sehrlich@lynx.northeastern.edu), KA1WNU/KT

3399. Dr-590 results (long)

Newsgroup: rec.ham-radio
Date: 1990-11-26 15:26:02 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9011261526.AA12053@lonexc.radc.af.mil>
Source record: 6401

hi,

I am back with the results from my battle with alinco. For those who have seen this before and are familiar with my quest the new info is on the last page of this posting. For those who are not familiar read on. For those who don't care oh well . . . .

Mail id: 2493
From: szarekw (William J. Szarek)
To: info-hams@ucsd.edu
Date: Thu, 11 Oct 90 10:07:26 EDT
Subject: re:Alinco DR-590T

In response to buzz here are my findings regarding the 590T

>I just picked up a brand new Alinco DR-590T and have had some problems that
>I would like to share with you all out there in ham-net land. Maybe someone
>out there can help me with a couple of these problems.

I guess not too many people have these rigs yet otherwise I would not have to respond to your request. I hope there are others besides yourself that are interested in this information. In any event this is what worked for me (sans jinglish). I am not however responsible for what you do to your rig . . . etc.

>1, I got this unit because of all the cool features it is supposed to have,
>including cross-band repeat. The instruction manual does not even mention
>this feature. After calling Alinco I found that this was a feature functions
>only after modification. They said (more than a week and a half ago) that they
>would send me the modification instructions. I haven't heard anything from
>them.

If you ask them (nicely) there are (a few) dudes at Alinco that are willing to help and are smart enought to be helpfull (there is a differance ;-}). They can fax you the information or even send it to you next day air at no charge if you ask politely or are VERY persistant (as in my case).
Now the big news . . . to modify the rig to xmit out of band (to call the cops etc ;-}), to operate as a cross band remote, etc. follow these easy steps.
1) remove the control head from the unit (2 screws on each side of the forward part of the rig, near the control head).

2) hold the control head in your hand face down and remove the two screws you see on the back of the control head.

3) remove the cover from the back of the control head (it snaps off)

4) locate a blue loop of wire. There is only one blue loop of wire.

5) cut, unsolder, remove, destroy, nuke, the blue wire (your choice) [I neither advocate nor encourage the indiscriminate use of nukes]

6) undo step 3

7) undo step 2

8) undo step 1

9) connect the rig to antennas, power etc as outlined in the manual.

10) hold down the function key and turn on the power

This is what you will find . . .
The rig now transmits everywhere.
it now will display (not receive) 800Mhz band and 300Mhz band on the 440 side of the display in rotation (press the uhf switch to switch from band to band)
It will now display (not recieve) the aircraft band (yes it does indicate AM) on the 2 meter side of the rig. There is no AM detector presently but I am working on it.

Cross band operation:
To enable cross band remote press (and hold) the funciton key and then (while still holding the function key) press the vhf switch. Cross band operation is now enabled using the displayed TX and RX frequencies. Splits still funciton in cross band operation so don't link 2 repeters together! Frequency selection for each band can be from the vfo, memory, or ARM (a cool Alinco function).
To disable cross band operation simply press (and hold as before) the funciton key and press the uhf switch. Note: failing to hold the f-key down and then pressing uhf or vhf enables a strange function that I have yet to figure out.

>2, The Autodialer (an option for the 590E according to page 13 of the manual)
>did not work as in the insturctions. Another call to Alinco and I found
>that it is also an option in the 590T. On page 19 it was pointed out to
>me is a note to this effect. These instructions are also unclear. Anyway
>I went out and purchased the required DTMF unit and installed it. Now I
>can store the numbers in the autodialer's memories, however I cannot get
>the rig to autodial any number except the number stored in memory #1. I
>have tried every possible interpretation of the directions on page 13 of
>the manual and had no success. Another call to Alinco . . . they told me
>that they knew that the manual was written in jinglish (japanese/english)
>and was hard to understand. They said that they would send me a complete
>manual written by someone who spoke english as their primary language. I
>asked them why this manual was not provided with the rig and they said that
>it was free to anyone who asked for it ?!?!

Simple problem . . . a typeing error (translation error?).
Turn to page 13 of the instructions
find "Transmitting the Stored Autodialer Number:(DR-590E: Option)

Step 2 should read:
Enter DTMF pad code c14 and select the desired autodialer channel.

>3, This rig is supposedly able to receive DTMF codes from another transmitter
>What will allow remote control of the rig (useful as a very flexible cross
>band repeater). I have not been able to get this to function on my rig at
>all. I can only hope that possibly the modification they promised to send
>me will enable this function or that the new english directions will beable
>to explain how to make this happen.

Even the grand Alinco wizzard has not figured this out. He said that he
was working on better directions and that as soon as he had them he would
send them to me.

>4, The remote page/DTMF squelch function are completely cryptic I hope they
>are also explained in the english directions.

Same deal as above. However if you sat around with a friend who also had
a similarly equipped rig you could probabily figure it out.

>Anyone with any mods or operation instructions for this rig please let me
>know. Am I the only one with these problems? Does anyone have any solutions?
>Is Alinco always this slow? etc.?

Here are your mods/instructions. Yes I believe you are. I found the solutions.
In my experience Alinco has always operated in this manner.

>I will post a summary when a solution is found
>so send responses to me at my address:szarekw@lonex.radc.af.mil

Here is the summary. In case you haven't figgured it out by now I am answering
my own query. I just figgured someone might want the info.

To: info-hams@wsmr-simtel20.army.mils
Date: Tue, 16 Oct 90 08:04:03 EDT
Subject: DR590T Remote Control
X-Acknowledge:

And now the long awaited jinglish - english translation for the remote control
of the DR-590t by a transceiver with DTMF. (and as a bonus a big disappointment)

The following is a direct copy of the info Alinco was kind enough to send me. [my comments appear in these brackets]

1. Set frequency
a, go to vfo mode and set desired frequency on the DR-590T, and fully open squelch. ("Busy" indicator will appear).
b, Set same frequency on the remote Transceiver, and fully open squelch. [not necessary]

2. Set Remote Channel and access code.
a. enter C10 on the DR-590 Touch Tone Mic Pad. *the frequency display will flash).
b. Enter channel selection (one numerical digit (1-4) and an access code (three numerical digits) on the DR-590T touch Tone Mic Pad. [it would be good for you to compare this part with the DSQ function descrition in the manual so that you can see "What is realy happening here"]

3. Enter DSQ function in the DR-590T
a. enter C!@ on the DR-590T Touch Tone Mic Pad.
(DSQ indicator will flash)
b. Push the PTT on the DR-590T Mic.
DSQ indicator will stop flashing and the "busy" indicator turns off)
c. Press the "f" (function) key and the MHz (up) key. The DSQ starts flashing again, and there will be a confirmation tone.

4. Access Remote Transceiver to DR590T
a. From the remote transceiver, transmit same DTMF access code (three numerical digits) as set into the DR-590T. The "Busy" indicator turns on the DR-590T (normally, you will hold the PTT on your remote transceiver and push the appropriate DTMF tones). [???? Jinglish again ?!?!?!?]

5. Initiate remote control commands
a. From the remote transceiver, transmit the desired "C" code (see page 14 of the DR-590T manual) from the dtmf Touch Tone Pad.
b. If you want to perform an additional remote commands you must remember to put the remote transciever in the same frequency that the DR-590T may be in. [how in the hell do you know if you are remote from the DR-590 and if you err durring a remote command how do you recover . . . more on this later] Retransmit the access code and the desired "c" code.

6. Cancelling the remote control function and turning off the dsq function
a. If the DSQ indicator is not flashing, enter C12 on the touch tone pad of the dr-590t. the dsq will start flashing.
b. With the dsq indicator flashing, press the MHz (down) button once. The dsq indicator will turn off.

--End of instructions from Alinco --

Now the bummer
This function does not allow you to control frequency selection/etc on the other band. (i.e. from 440 you cannot switch over to 2meters and change frequency and then go back to 440). You cannot operate this function in conjunction with any of the memories, you must remain in VFO mode. This

function does not opperate in cross band remote mode.

I am a bit miffed that Alinco didn't see this through. They could have created the all time worlds greatest mobile rig that would allow one to access it via 440 and then work any of your favorite 2 meter repeters operating as a remote base. They even saw fit include a dtmf function that allows you to remote key the transmitter (rather than running as a repeater). This in conjunction with the other functions that are 1/2 implemented certainly say something about Alinco.

Counter point
It is still a great radio and I would buy it again still knowing what I know now. The only differance is that I wouldn't be as disappointed when I found out that the rig doesn't "really" do all that Alinco says it can do.

Any way I hope you enjoy your rig as much as I enjoy mine.

73
buzz
KE2WD

****
Now the good news.

After working with(?) alinco regarding the "features" of this rig I have discovered how to repeter hop using the remote base (cross band feature) of DT-590.

Start with the rig in 'normal' mode. (just like you would use it normally).

On the 2 meter side of the rig select a known repeter on a frequency above 147.000 Mhz including the positive (this is important) offset and put this frequency and offset into the vfo.

Press the function button.

Press the up or down buttons on the microphone untill memory channel A is selected on the display.

Press Memory Write key.

Key the mike (don't forget to I.D.).
If you hear the squelch tail from the repeter you will have stored the repeter frequency in the ARM. (see Alinco instructions for operation of this feature, they are not to bad).

Now enter any repeter frequency below 147.000MHz including the negative offset.

Key the mike (ID) and listen for the squelch tail.

notice the negitive offset.

now enter any repeter frequency and you will notice that the offset will automatically be "-" for repeter frequencies lower than 147.000 and will be "+" for repeter frequencies greater (or equal to) 147.000 in accordance with

the commonly accepted bandplan.

This will function in the remote control mode so now you can repeter hop with your remote base unit, controling it with your 440 HT. Nothing like a 45 watt handheld!

Enjoy

WM1W

P.S. I haven't called Alinco yet so they still don't know about this feature. Up to now they have told me that this function was imposible and that if I discovered how to do it please call them otherwise please leave them alone (I've been quite a pest). So in the true spirit of ham radio I decided to publish my findings here . . . before I called alinco. That way "we" know where "they" got "their" information from ! |-}

Source record: 6404

A quick question to any experts on PArt 97:
A friend and I, recently started into VHF (2M) packet radio, were wondering if it'd be legal to interface a TNC with a standard telephone modem to allow us to call landline bulletin board systems while mobile. The interface would be "one-way" ie - we could call out but noone could call in.
The system would be used only for our enjoyment - nothing involving buisness.
Please reply to MATTHIAS@PINE.CIRCA.UFL.EDU (internet) or MATTHIAS@UFPINE (bitnet).
Thanks in advance for helping with this..

As a point of trivia, I've been wondering which single ham repeater has the largest coverage area accessable with ordinary equipment. This question includes all repeaters, but is limited to the area served by a single machine (not the area served by multiple linked machines).

For example, the Mt. Lemmon Repeater, 147.15, is one of the farthest reaching that I can think of. It is located at a level of 9000+ feet and has an extremely high HAAT (Height Above Average Terrain). It can be accessed with a handheld from Phoenix, over 100 miles to the north. This would seem to indicate that it covers an area of nearly 30,000 square miles. Given that much of this is probably shaded, I would guess that 15,000 is not unlikely with this machine. This area does not include the other machines in the ZIA link which are conected to the 715 machine (a good story by itself).

Which other machines around the contry or the world are in this category? Which machine do you think would rank as the worlds largest in terms of coverage area?

Inquiring minds want to know... :-)

Since you ask...
97.115(b) The third party may participate in stating the
message where:
(1) The control operator is present at the control
point and is continuously monitoring and
supervising the third party's participation...

Note the use of the word "continuously." That means the control op must
review (monitor) *all* of the third-party communications, not just some
portion thereof marked mechanically.

Because there are still a number of people out there in satelliteland
using programs that can read only the old format. If I recall correctly,
there was some discussion of this question within AMSAT, but they opted
to continue supporting those people. Personally, I consider it darn
nice of AMSAT to take that attitude.

Which other machines around the contry or the world are in this category? Which machine do you think would rank as the worlds largest in terms of coverage area?

Well, if you count 10 meter repeaters then in theory any one of them would rank as worlwide coverage. I have worked Europe, Japan, S. America as well as most of North America through 10 meter a repeater here. Of course I was on 440 at the time so maybe that doesn't count for your contest....

And 100 miles given that kind of altitude isn't spectacular. I can work the Wachusset Mt 440 repeater (about 2000') while hiking in the White Mountains (about 4000') with an HT. I don't have a map in front of me but I would guess about 100 miles there.

I am sure people will come in with some good stories on this thread...

Somewhere in Canada recently they instituted legislation along these lines,
using detector detectors. There, they confiscated them, issued a fine, and,
on the spot, put a hammer through the top of the detector..

Fortunately, they weren't confiscating the units belonging to non-residents..

From: mac@idacrd.UUCP
Message-ID: <815@idacrd.UUCP>
Source record: 6411

Hi:

We had an outstanding weekend at N2RM in the CW contest. I ran 160 meters the entire weekend from opening to closing and operated Saturday afternoon on 40 and Sunday morning on 10. Our score (before we have gone over the logs with a fine toothed comb) was 17.58 million. This was just enough to edge out K1AR. The scores are incredibly close and if there is a missed or dropped multiplier or we have more broken calls than they, the boys from New England could come out on top. At any rate, it was a good weekend everywhere except on 10 meters. We had the most Q's on 10 but it was 900 fewer than the phone weekend. BTW, our 160 station was definitely LOUD ;-). We either had more Q's or multipliers than any of the other contenders on 160! I hope everyone gets to operate a decent, if not winning, multi-multi sometime. It's a blast! BTW, the score above is a new US record by a million points and since AR is so close, one of us will surely set a new US CQWW CW record. The highlights of the weekend (besides 160 ;-) were an absolutely stellar performance by N2AA and K2TW on 20 and KZ2S/N2ME on 40. 80,15, and 10 were either ahead or close to the other big US stations but these two bands were clear winners.

A parting thought: don't neglect 160 on the last evening of the contest. The opening to Europe and Africa was just outstanding and I got five countries and one zone in the closing 1.5 hours of the contest. N2NT reported similar results for 160 in his either 1st or second place single op unassisted run (He's close in with K1CC). I worked CN5N in the last 10 minutes!

3412. fcc regulations

Newsgroup: rec.ham-radio
Date: 1990-11-26 19:42:01 UTC
From: jerrys@canada.sbi.com
Message-ID: <107@canada.sbi.com>
Source record: 6412

Hi,
I just ran into a situation at work and I thought that someone here might be able to help me. We have installed a number of HT and repeater stations at work. My company has two main sites in the metro ny area, one in downtown new york, and the other in rutherford.

Well, to make a long story short, the guys in new york have asked me to give up my repeater station to them. I don't really need it much as there are only a few dead spots at our location that our HT's can't cover. However, here's where it gets interesting.

I asked them what they plan on using it for. Well, it turns out, that all they really want is another frequency allocation. The vendor has told them that they can't get one unless they also get a repeater. The vendor says that the fcc won't give out additional simplex frequencies unless you also have a need for repeater frequencies. Sounds kind of absurd to me.

So I called the local fcc office. Unfortunately, all I got was a polite, but totally ignorant secretary who took a message. The "person that handles this is out in the field".

Well, I am now turning to my ham "friends" for help. Does anyone know if we are getting a crock of s _ _ _ from the vendor (probably) ? Does anyone know who at the fcc I should be calling to get this squared away ??

Thanks in advance for your help folks.

People working portable microwave stations in the ARRL v/u/shf
contests have reported that the W2SZ/1 station on Mt Greylock has
pegged their radar detector from 30 miles away on 24 Ghz. I plan to
use one next time in addition to the usual array of gear for 8 bands.

hmm... maybe mount it on a dish...

3414. HELP with an FM construction project!!

Newsgroup: rec.ham-radio
Date: 1990-11-26 19:51:00 UTC
From: CRISP@WCUVAX3.WCU.EDU
Message-ID: <9011262053.AA26044@ucsd.edu>
Source record: 6414

Hello fellow networkers.

I would like to establish communication with a broadcast engineer,
or someone in this line who has a good understanding of the processes involved
in FM stereo broadcasting. Knowledge of the internals of a stereo generator,
etc. would be just what I'm looking for. I'm working on an experiment, and need
a few construction tips.

Regards,
Russ Crisp

I would guess one of the sattelites. You can hear DOVE-1 with
a rubber duck antenna on an HT, though it isn't strictly speaking
a repeater.

There are a few 100 mile range repeaters (from a handheld) around here.
I don't think the coverage areas are anywhere near round though.

If you mean 2 meter repeaters, on the California coast every couple of years when a good ducting condition settles in, one can access the Hawaii machines... Accessing repeaters up and down the coast over the water at distances of 200+ miles on 2 meters is common.

3417. Re: Request for information on the SARSAT satellites

Newsgroup: rec.ham-radio

Source record: 6424

The SARSAT satellites broadcast information received downwards to a ground station, if one is within the footbprint. Most of the processing is done on the ground. The satellites have ability to store (and forward) data burst information from the new 406 Mhz. ELT's.

Since there are several satellites, many ground stations, etc. putting the information together from several satellite passes is done by the ground network rather than a "Master" satellite.

I have technical data at home, I will look up the frequencies. Don't expect to be able to listen with your PRO-2004.

3421. ic751a vs ic751 microcode problems

Newsgroup: rec.ham-radio
Date: 1990-11-26 22:11:38 UTC
From: jeff@xanadu.com
Message-ID: <1990Nov26.221138.2724@xanadu.com>
Source record: 6328

>Does the ic751a have the battery backed-up RAM microcode as does the
>ic751?

Icom has fixed this problem in the 751a. Recently I went looking to buy
a new hf radio. The 751a was considered, and in Icom's sales literature
I noticed that they explicitly stated that the microprocessor code is
"permanent". The 751a was a little pricey so I bought the TS-440 instead.
Funny thing; I was asking my brother for his opinion, and he brought up
the issue about battery backed program code. I didn't know about it until
then, and assumed that all the radios had their code in eprom.

3422. Anyone built WWVB receiver?

Newsgroup: rec.ham-radio
Date: 1990-11-26 22:25:20 UTC
From: elmquist@nachos.SSESCO.com
Message-ID: <266@nachos.SSESCO.com>
Source record: 6351

Does anyone have a reference or clues to same for a 60 KHz WWVB receiver design? I'd like to play with such an animal as well as antennas for VLF. Are there any designs for active VLF whip antennas (like those used for LORAN on boats) floating around?

Any info would be appreciated. Thanks!

Chris

From: keith@hpfcdj.HP.COM
Message-ID: <18230049@hpfcdj.HP.COM>
Source record: 6330

I've been running a 80M full wave loop (inspired by the same QST article) for about a year now and while I really don't have a lot of data (used only once a week for a sched on 20M) it has been a very satisfactory antenna for me. Mine is very close to a square with two ends supported by the far ends of the house and the other two by poles in the back yard. Height ranges from 25' to 20'.

Perhaps this is as useful: contact

X3 Secretariat,
Computer and Business Equipment Manufacturers Assoc.,
311 First Street NW, Suite 500,
Washington, DC 20001-2178

Attn: JPEG Draft Technical Specification

Ph: (202) 737-8888, Fax: (202) 638-4922

The document, for review and comment, is available for $8.

For a very short paper on JPEG, you might look at

Wallace, Gregory, K., "Overview of the JPEG (ISO/CCITT)
Still Image Compression Standard"

The copy I have is a preprint that states that it was
to be published in the 1990 SPIE/SPSE Symposium on
Electronic Imaging Science and Technologies, Feb. 1990,
Santa Clara.

The paper includes references to other pertinent material. Oddly
enough, it did not reference Pratt's "Digital Image Processing,"
where you will find early work on the discrete Cosine Transform.

3425. MAJOR SOLAR FLARE ALERT

Newsgroup: rec.ham-radio
Date: 1990-11-27 08:51:33 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901127015133.2040322d@HG.ULeth.CA>
Source record: 6331

/\/\/\

Region 6377 (S04W29 at 24:00 UT on 26 November) continues to grow in size and has produced eight subflares over the past 24 hours. It is expected to be a frequent source for C-class flares and subflares with a risk for occassional (albeit, less frequent) M-class flaring.

The Space Environment Services Center has restored the potential PCA alert status to a condition GREEN level, with the passage of Region 6368 beyond the west limb. Flare probabilities for the next 72 hours (ending 29 November) follow:

Flare Probability Type	24hr	48hr	72hr
Class M Flare	60%	40%	40%
Class X Flare	10%	02%	02%
Proton Flare	02%	02%	01%

Overall flare activity will subside as Region 6368 crosses the west limb. Region 6377 will continue to provide frequent C-class flares and subflares, although M-class flare activity should drop noticably over the next three days, provided no new hot spots rotate into view on the eastern limb.

POTENTIAL TERRESTRIAL IMPACT FORECAST

Todays major solar flare is not expected to have a terrestrial impact. It was too distant (on the west limb) and was not physically large enough to affect the earth from our position. Hence, the predictions and charts which were posted in the Solar Terrestrial Forecast and Review still apply and are not expected to be affected by this major flare.

Geomagnetic and auroral activity has increased as expected over the past 24 hours. Currently, unsettled conditions are in progress with occassional brief bursts of active conditions. Auroral activity has remained confined to the auroral regions, but has degraded signal quality over many middle latitude regions. Conditions are expected to return to quiet to unsettled levels by 29 November, in close agreement with the prediction models previously posted.

Thanks for all the answers I got to my post, guys (and gals). I think that my train mobile op is shaping up to look pretty good. I've got 110 VAC available (from the outlet), but I'll probably be using battery and switching them back and forth. As for an antenna, I think at the moment I will try something along the lines of what the first STS amateur experiment did (dipole made out of 14 gauge taped to the window, running into coax terminating in a BNC). That seems fairly foolproof. 19 inches seems to be the going rate on length, so I should find it all fairly easy to fabricate. This antenna seems to be the best comprimise I could find tween "easy to carry" and "best signal". Someone mentioned a j-pole somewhere on here, but my mailer chewed it up on me. Could someone send that to me again? (privately, please).

Well,back to the books.

(as everyone breathes a sigh of relief after reading a post that had no political statement in it)

3427. QSL Card Dimensions

Newsgroup: rec.ham-radio
Date: 1990-11-27 13:16:09 UTC
From: edg@netcom.UUCP
Message-ID: <17562@netcom.UUCP>
Source record: 6360

Rather than going to a QSL printer, I did some desktop publishing and took my QSL art to a copy shop. They did a good job except they made the cards 4 x 5.5 rather than 3.5 by 5.5. They defended their decision since the cards still fall in post office spec.

I am afraid that they won't go through the QSL Bureau if they won't fit in their sorting systems and envelopes. Can anyone confirm or deny this?

The copy shop will redo them if I insist, but I have to redo the artwork -they say they need more white space top and bottom to guarantee the cut. I think the art could fit fine in 3.5 inches and think they're wimping out.

Anyway, I need to know if the cards are actually too big for the "sorting and forwarding service" that I told the copy shop was involved. Anyone know for sure?

3428. Radar Detectors (was another look . . .)

Newsgroup: rec.ham-radio
Date: 1990-11-27 13:37:32 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9011271337.AA02910@lonexc.radc.af.mil>
Source record: 6333

Joe, (and other outlaws who own those dangerous radar detectors)

I was recently stopped by a State Police in the state of CT. I was not
speeding (60 mph max).

The officer said that he noticed "lights" flashing when he hit me with the
radar and he wanted to know if I had a radar detector and did I know that
they were illegal in CT.

I explained to the officer that I did indeed have a radar detector and that
I did know that they were illegal, however . . .
I wasn't using the radar detector to allow me to exceed the speed limit as
he noted I wasn't speeding. I explained that I am an amateur radio operator
and simply monitor the portion of the rf spectrum used by law enforcement
radar so that when such a signal is detected I refrain from transmitting.
Even though my equipment is carefully kept within emission standards there
may be a chance that the law enforcement equipment might be sensitive to
one or more of my transmissions and I wouldn't want to make their job of
law enforcement any more difficult than it already is.

The officer thanked me for my considerations, smiled, asked a few more questions.
and we parted company (still friends).

Please note that I don't advocate violations of the law,
Nor would I hide behind my Ham ticked if I was quilty.
I simply wasn't speeding. Please don't ever ever ever use this reason for
radar detector possession if you have been clocked at above the posted speed
limit. Such an irresponsible action would only serve to bring discredit
on the amateur community.

Fred, I lived in Kingman, Arizona for a little over a year and enjoyed the heck out of the 146.76 repeater there. It was at 8500' in the Hualapai Mountains and we had regulars from Orange County check in with 40' towers and 11 element Cushcrafts. That is a crow-flies distance of about 275 miles. It had great talkie coverage all over NW Arizona.

Gary Skaggs - WB5ULK skaggs@nssl.gcn.uoknor.edu DOC/NOAA/ARL/ERL/NSSL

"The correct way to punctuate a sentence that starts: 'Of course it is none of my business, but...' is to place a period after the word 'but'. Don't use excessive force in supplying such a moron with a period. Cutting his throat is only a momentary pleasure and is bound to get you talked about."

3430. Antenna Matching

Newsgroup: rec.ham-radio
Date: 1990-11-27 15:25:00 UTC
From: MOSIER@UNCG.BITNET
Message-ID: <FAA5656555BF200363@uncg.bitnet>
Source record: 6335

I'm in need of antenna guru advice.

I am putting up a Zepp antenna cut for 7.1 MHz. The ARRL Handbook says that such an antenna fed with balanced line will operate at all frequencies above what it is cut for. It also says that the feed line should drop perpendicularly away from the antenna for at least a quarter wavelength. My question is what to do with it after that. I know it needs to go into my transmatch, but after it drops a quarter-wavelength, it is down at ground level (I could only get the dipole about 35 feet in the air). My rig is on the second floor of the house. Now, do I just turn the balanced line around, go back up in the air, under the window, across the room, and to the transmatch? Or do I make a balun of some sort to a coax transition at ground level and then handle the coax from there on as usual (i.e., running it anywhere I can get it through the house walls). There is a well-advertised commercial antenna (is it a G5RB dipole or something like that?) that drops balanced line for quite a way into a "black box" with coax out. What sort of a balun is that? Never having used balanced line before, I'm a little uncertain of what I can do with it, namely where I can run it, what kind of corners I can turn, etc. (As a starter, I'm using that real wide stuff that looks like TV twin lead with alternating patches of the center plastic cut out. After I learn to handle that, I though I would look for some of the open wire with discrete spacers.) Having only used coax feed for 33 years, I thought it was time to learn balanced line.

3431. HC901204.ZIP - HamComm: Transmit/receive RTTY with PC/XT/AT

Newsgroup: rec.ham-radio
Date: 1990-11-27 16:06:40 UTC
From: schroeder.pad@nixbur.UUCP
Message-ID: <1563.w8sdz@wsmr-simtel20.army.mil>
Source record: 6336

I have uploaded to SIMTEL20:

pd1:<msdos.hamradio>
HC901204.ZIP HamComm: Transmit/receive RTTY with PC/XT/AT

HamComm currently allows for transmission and reception of amateur teletype signals. The interesting thing about it is, that it doesn't require a modem. The audio output of the transceiver is connected to a serial port of any PC/XT/AT compatible computer thru a very simple and low-cost circuit. You need only one ic (op-amp LM741) and a few diodes, capacitors and resistors. For transmission the speaker output is connected to the microphone input of the transceiver thru a passive r/c filter. Estimated cost is about 10$. Audio frequency decoding and serial/parallel conversion is all done by the program.

HamComm will run on XT maschines but the graphics display of the input signal is more fun to watch on an AT-class maschine. Nearly all of the functions can also be controlled by using a mouse. The program automatically detects the type of display adapter in use. MDA, CGA, EGA, VGA and Hercules are currently supported. A harddisk is not required. All text are written in english and the online help function includes the schematics for the interface circuit. There are also predefined standard phrases and ...

Sorry, i got carried away :-)

best regards.

My work colleague, KE9ZM, used a Mac and Pixel Paint to do a rather wild QSL
card to use for his mobile contacts. He printed those on a Laserwriter
using postcard weight card. They are very nice (altho quite yellow).

Observing his production of the card, I seemed to recall that someone on the net generated
cards using postscript. If my recollection is correct, I would
appreciate corresponding with that person with the possibility of receiving the postscript
commands.

Thanks.

If you know about the Mt Lemmon repeater, you should surely be familiar with the Kingman machine. Once you get away from Lemmons shadow, you can talk to LA and Las Vegas through it. There are also some great coverage repeaters in the central Colorado area, up around Cheyenne, and over in the western Montana area. Oregon has a few nice ones, too, including a wind/solar powered repeater *very* high on Mt Hood which covers about two thirds of Oregon and a goodly portion of southern Washington. I have read of repeaters on the East Coast, I believe in the NH area that have 150+ miles of radius.

Mountaintops can be great!

Now talk about a super (depending on whose opinion you ask) repeater/linking system, can somebody provide any technical descriptions of some of the railroad systems (BN and UP) across the Dakotas, Wyoming, Montana, etc? On one channel, 160.???, I could hear the same maintenance crews, trains, dispatchers, etc, for several hundred miles and I know it wasn't all from the same transmitter.

73,
Michael

This may or may not be of interest to people, but in addition to the shuttle status reports posted to this group, there are "Shuttle Status" (ss), "Payload Status" (ps), "Launch Advisories" (la), "Headline News", etc available on ames.arc.nasa.gov (128.102.18.3) via ftp. The are in a directory pub/SPACE and are in files such as ss11.26.90 (which means shuttle status for 11/26/90). There are so many files in this directory that doing an ls or directory isn't practical, but doing a dir ss11* will give all Nov files for this and past years. The availability of the reports is not allways reliable, probably due to how busy the individual who posts them is. For the last three launches there was a flurry of reports up thru a few days before the launch, and then nothing. I'm not sure if the ametuer radio efforts are followed in the ps series or not, I've only read a few. An example of a recent ss file (ss11.26.90) follows.

****
Monday November 26, 1990 10:00 a.m. EST

KSC SPACE SHUTTLE PROCESSING STATUS REPORT

STS-35 -- Columbia (OV 102) - Pad 39-B

Work continued over the weekend on the shuttle Columbia for mission STS-35. A scheduled replacement of an APU gaseous nitrogen line quick disconnect was completed on Saturday. Sunday, the pad was closed for ordnance operations. Today, technicians will begin operations to pressurize the hypergolic tanks in the OMS pods. Work in the aft compartment will continue once the pad is open after completion of hypergolic operations today. Aft operations are scheduled to be completed Wednesday.

The payload bay doors will be opened later this evening and final servicing of the BBXRT payload is scheduled for Wednesday.

A target launch date for mission STS-35 and the ASTRO-1 observatory is expected to be announced following the Delta Flight Readiness Review. The FRR is scheduled to begin at 8:00 a.m. tomorrow in the Operations and Checkout Building's mission briefing room.

STS-39 -- Discovery (OV 103) - OPF Bay 1

Ammonia boiler freon loop decay checks were performed over the weekend on the orbiter Discovery in the Orbiter Processing Facility. Bubble soap leak checks were conducted with several leaks identified near the cold plate manifold. Work will continue

today to replaced the cold plate manifold seals.

X-rays of the orbiter body flap have been completed and
routine work on the wheels and tires will continue today.

STS-37 -- Atlantis (OV-104) - OPF Bay 2

Normal post-flight safing operations are continuing today on
Atlantis in the Orbiter Processing Facility. Cryogenic drain
operations were completed last Friday and the thruster plugs have
been installed on the vehicle. The payload bay door strong backs
are being installed today and the doors are scheduled to be
opened tomorrow.
****
an example of a payload status (ps11.13.90) follows.
****
Daily Status/KSC Payload Management and Operations 11-13-90.

- STS-35 ASTRO-1/BBXRT (at Pad-B)

Experiment monitoring continues.

- STS-39 AFP-675/IBSS/STP-01 (at CCAFS)

CITE preps continue at the VPF. STP-01 will arrive at CCAFS
today.

- STS-40 SLS-1 (at O&C)

Power on IPR/PR troubleshooting will be performed today.
CITE closeout operations continue.

- STS-37 GRO (at PHSF)

No work is scheduled for today.

- STS-42 IML-1 (at O&C)

Module staging will be active today.

- STS-45 Atlas-1 (at O&C)

Experiment and pallet staging continue.

- STS-46 TSS-1 (at O&C)

Power on systems testing continues.

- STS-47 Spacelab-J (at O&C)

Rack staging will work today. Also the SREM will be
unloaded.

- STS-67 LITE (at O&C)

Pallet staging will be active today.

- HST M&R (at O&C)

Preps for the transportation of the pallet to GSFC will be
active today.

Communications needs vary. I go 4 wheeling quite often. When I go with
other vehicles, I have two CB rigs (besides the one in my jeep) I loan out
so that as many vehicles as possible can communicate. CB is cheap and
effective for that application.
On the other hand, if one needed to summon medical assistance via
phone patch, it's probably a better bet that you'll find a 2m repeater to
get help. You might have to drive to some point for line of sight but
it's likely to be more effective to do that than to try Channel 9.

My most difficult radio +driving task was when I led a caravan where 5
vehicles had CB and 1 had 2m. Operating 2 radios and driving a 4WD
road at the same time was interesting.
(I later rescued that ham from a 4WD breakdown that he called me
about via phone patch from 75 miles away :-)

CB is not useless but it's not the entire answer. Neither is 2m FM.

Sometimes a raised middle finger is the simplest, most effective
mode of communications :-))))

How about W2IBJ?? Freq = 29.66 (-100)
Covers all of the US, the Caribean, South America and probably Europe and
Africa too.
Comes up about 0730 EST and goes off about 12 hours later. I guess they
don't have much in the line of commercial power there.

:-)

Many foriegn cards are larger than the 'standard' US cards. The larger foriegn cards seem to go thru the bureau just fine. However, for people like me who send a SASE to a stateside manager or individual, your card will not fit in the SASE I use stateside. For foriegn SAE's I use the European sized envelope.

The multiple-sections-of-coax antenna sounds like one that has been written up in ARRL antenna handbooks for a number of years. Dunno if it's still in the latest one. I don't have the numbers handy, but did build one and found the feedpoint impedance to be about twice what it was supposed to be... In spite of that, the antenna seemed to work OK, though I never did any quantitative gain measurements on it.

WWVB references
---

1. "A WWVB 60 kHz Frequency Comparator Receiver" by Ernest P. Manly, _73_ Magazine, Sept. 1972. The now-obsolete RTL integrated circuits in this design can probably be replaced with CMOS. It's similar in function to the Hewlett-Packard 117A VLF Comparator but has no phase-locked oscillator output.

2. Don Lancaster published plans for a 60-kHz WWVB receiver with time-code output, in _Radio-Electronics_, August 1973, p. 48. Methods of phase-locking are discussed. This article tells how to decode the WWVB time format, and includes a signal-strength map. I had trouble receiving WWVB here in Indiana until I got a Burhans voltage-probe VLF preamp and Burhans VLF converter. Now it's one of the strongest signals on VLF. Previously, I used a Palomar Engineering VLF converter, which is worthless by comparison. The main receiver is an Icom IC-720. Sometimes I must run everything on battery to eliminate line noise.

3. "Low-Frequency Receiving Techniques," a series of articles by R. W. Burhans in _Radio-Electronics_, March-July 1983, describes LF/VLF active antennas, and a method for using LORAN-C (100 kHz) for time and frequency calibration. A set of reprints, with errata/addenda, is available from the author for $4.00:

Burhans Electronics
161 Grosvenor St.
Athens, Ohio 45701

Send SASE for catalog. See also Prof. Burhans' three-part article about Omega navigation receivers (10-14 kHz) in _Byte_ magazine, February, March, April, 1977.

Hmmm. The 'Zia Connection' is a series of 11 or so repeaters that
covers from eastern California, most of Arizona and NM, and parts
of west Texas.

To your original question, there are several repeaters here
in NM that would qualify as wide area machines. Mt Taylor
and the Sandia Peak machines are both over 10,500 ft elevation,
and cover hundreds (thousands?) of square miles.

Thank you for sharing that with us. Unfortunately, it has nothing to do with the topic we were discussing. The segment you quote relates to a third-party DIRECTLY manipulating the amateur stations' on-the-air transmissions in real time. We are discussing non-realtime "store and forward" transmission of Internet newsgroups. In such a matter nothing is said about the mechanics of ensuring compliance with rules governing message content. There is no reason to assume, based on anything in Part 97, that a licensee or his designated control operator may not legally employ mechanical aids to enhance his ability to achieve that compliance with a minimum of physical labor.

Source record: 6350

```
**********************************
*** GEOMAGNETIC STORM ALERT ***
**********************************

Issued: 19:00 UT, 27 November

Geomagnetic Storm Alert
Auroral Storm Warning
Revised Forecasts

-------------

Attention:

The effects from a coronal hole are having a stronger impact than was
expected. The geomagnetic field hit major storm levels over middle latitudes
between 15 UT and 18 UT on 27 November. This burst of activity follows a
period of unsettled to active conditions which has lasted approximately 20
hours (as of 19:00 UT on 27 November). Predominantly active to minor
storming has occurred in the higher latitudes over the past 6 hours.

The geomagnetic field is expected to range between active levels and
minor to major storm levels over the next 24 hours. Regions which will be
affected most severely will be the higher latitudes and northern middle
latitudes. High latitudes may experience bursts of major storming,
particularly during the evening and local midnight periods. Middle latitudes
will likewise experience potential minor storming between the evening and
midnight periods. Activity should peak between local midnight and near 3 am
local time (ie. in your local time zone).

The geomagnetic activity A-index for Boulder reached 35 at 18:00 UT,
which is within the lower bounds for a minor storm. Activity near the 50th
parrallel is estimated at an A-index of near 38. The storm will be monitored
closely. Activity should subside by 29 November.

An Auroral Storm Warning has been issued for the high latitude regions.
An alert to the potential for auroral storming has been issued for middle
latitude regions. Auroral activity on the evening of 27 November may become
quite strong over middle latitudes. Low latitudes may be able to spot
diffuse auroral glows far to the north. The auroral zone has expanded
southward slightly over the past six hours. No significant southward expansion
is anticipated. Reports of any observed auroral activity from low latitudes
would be appreciated.

HF radio propagation will be poor during the local evening and midnight
hours on 27 November. Signficant amounts of auroral flutter and fading will
affect middle and high latitudes. Low latitudes will also experience
```

noise and fading, particularly over northerly paths.

There is a fair possibility for some potential auroral backscatter communications over VHF frequencies near sunset and later tonight (near local midnight on 27/28 November). Area's most susceptible to auroral backscatter communications are the northerly middle latitudes, although middle and southern middle latitudes may also experience periods of backscattering. Signals on backscattered paths will be quite poor, with significant amounts of sputter. CW communications should prove most reliable over potential backscatter paths.

The following forecast charts have been modified to reflect the recent increased geomagnetic and auroral activity:

Hi,
Time to call on all you experts out there. I have come across a vendor selling a wireless lan which operates on the 902-928 MHZ frequencies under low power, unlicensed.

I was wondering (since I don't have my allocation chart handy) if anyone knew if this range is allocated to a ham band ? Someone elses use ? A joint assignment ???

Any and all information regarding these frequencies would be most helpful.

Thanks in advance!

Yes, radar dececors are illegal in Virginia, and also in Conneticut
(sp?). These are the only 2 states that I know of which ban these,
but I guess they could stretch the monitor law in New Jersey? :-)

I see!!! The way you learned things is the ONLY way to learn things. If you are so sure there is a crime there, you have the authority to look into it and see that JUSTICE is done. Think back Joe to your learning days. When you learned it, I'll bet that you didn't really take more than the 20 hours stated. And did it ever occur to you that maybe...Just maybe, these folks are actually learning to pass the course. I congratulate you on being and old fart as I am, but I think that you are way off base here, unless you can prove somehow that this guy is really cheating somehow. As far as your crime comparisons....Are you from the real world or do you really beleive that gun control, and crime prevention are really on the same level criminally as this suspected crime.

PROPAGATION FORECAST BULLETIN 48 ARLP048
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 26, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX STARTED AT 145 IN NOVEMBER, DIPPING TO 140 ON THE
SECOND DAY. THE CURVE THEN TURNED UPWARD, REACHING 215 ON THE 8TH.
THEN FOLLOWED TEN DAYS OF UPS AND DOWNS, THE FLUX DROPPING TO 186 ON
THE 18TH AND THEN RISING TO WHAT WILL PROBABLY BE THE NOVEMBER HIGH,
223, ON THE 17TH. IT WAS ALL DOWNHILL THEREAFTER, THE FLUX DROPPING
TO 167 BY THE 25TH.

THE TWO LARGE SPOT GROUPS THAT PROBABLY WERE THE PRINCIPAL SOURCE OF
ENERGY THAT BROUGHT THE SOLAR FLUX UP TO 223 WERE DISAPPEARING
AROUND THE WESTERN EDGE OF THE SUN OVER THE WEEKEND. THERE ARE
SMALLER GROUPS STILL IN VIEW, AND SOME NEW ACTIVITY WAS JUST VISIBLE
ON THE EASTERN EDGE SUNDAY AFTERNOON.

EVERYTHING VISIBLE OVER THE WEEKEND APPEARS TO BE SMALLER THAN WOULD
BE REQUIRED FOR ANY LARGE INCREASE IN THE SOLAR FLUX THIS WEEK. ON
THE OTHER HAND, THIS IS THE BEST TIME OF YEAR FOR NEARLY WORLDWIDE
COVERAGE ON 28 MHZ AND POSSIBLY EVEN 50 MHZ. CHECK WWV BULLETINS AT
18 MINUTES PAST THE HOUR FOR THE LATEST INFORMATION ON THE SOLAR
FLUX LEVEL.

THERE WAS NO AMERICAN SUNSPOT NUMBER REPORT PHONED IN THIS WEEK.
CHECK NEXT WEEK'S BULLETIN FOR THIS DATA. SOLAR FLUX NUMBERS AS
REPORTED BY WWV FOR NOVEMBER 15 THROUGH 21 WERE 212, 210, 223, 203,
196, 190 AND 182, WITH A MEAN FIGURE OF 202.3.

3454. Re: Anyone built WWVB receiver?

Message-ID: <10510012@hpcuhb.cup.hp.com>
Source record: 6357

most VLF receiver system antennas are really just a large loading coil connected to a smaller (electrically very short) antenna. Loran receivers on boats use small whips which add little to the antenna performance. The ferrite loading coil probably contributes as much or more then the small whips (look inside any AM transistor radio, the antenna is just a ferrite rod).

The handbook has some discussions of LF antennas. One I have used very successfully in a small space was a bicycle tire rim wrapped with several hundred turns of #38 wire (the rim is strictly a coil form). This worked well for reception down to 10 khz. I used this to monitor meteror hits on the earths atmosphere. For Loran reception at 100 khz I have been quite successful with 4" ferrite rods resonated to 100 khz. Of course Loran is a very powerful signal.

Good luck.

Brian Boschma.

>I am looking for any information about the SARSAT search and rescue
>
>satellites.

The SARSAT project was managed by Goddard Space Center, however, there is no longer a listing in the current (10/90) or previous (4/90) internal phonebooks for the SARSAT project manager. This means the project is no longer operational or that management has been transfered to another agency. You could try the GSFC Public Affairs Office (301-286-6255) or possibly NOAA.

Sorry I can't be more help.

>that, I though I would look for some of the open wire with discrete spacers.)
>Having only used coax feed for 33 years, I thought it was time to learn
>balanced line.
>
It is a G5RV. I'm using one of them, and I'm extremely happy with it. It is
about 12 feet off the ground (barely clears the ridge of my roof), and the
down-feed goes down about 2 feet, then follows the roof contour until it drops
over the edge. Then it runs horizontal for about 4 feet before it goes into
the "black box". My co-ax runs about 10 feet from there to my rig.

There is a dog-leg of about 15 degrees at the center insulator because I anchor
it at the chimney while the ends run to two trees. I always get good reports
using this set-up, and some think I'm kidding when I tell them about it. Don't
ask me how it works as well as it does. It seems to defy every antenna theory.

I have a tuner, but rarely use it. It works just as well without it. Of
course, I'm running a tough old Heathkit SB-102; I might be more particular if
my rig was one of the "modern" ones that need a low SWR.

Anyway, that's for what its worth.

73,
Dube N5PDK

> - Jerry Kaidor, KF6VB

The volunteer examiners don't get a nickel. At least at sessions I have attended, every penny of the $4.75 (or whatever it's up to now) goes to the Volunteer Exam Coordinator (in our case, ARRL-VEC). We never even get our hands on the money, since the check is made out to the VEC. In fact, we have to cover our own miscellaneous expenses, for which we are reimbursed by our local ham club.

Examinees are getting a very good deal, both financially and from the standpoint of availability of test sessions, compared to the "bad old days" when the job was done by the FCC.

I have used a 144 MHz Isopole successfully. I "believe in it" much more
than ground plane-less antennas such as the Ringo Ranger, but have no
experimental data to back this up.

3462. transvert a CB radio to 6M am subband?

Newsgroup: rec.ham-radio
Date: 1990-11-28 02:15:44 UTC
From: rfc@briar.Philips.Com
Message-ID: <113663@philabs.Philips.Com>
Source record: 6184

Anyone ever transvert a CB radio to operate in the AM portion of the 6M band? Easy/hard to do? worth the effort? BTW, how does one do such a thing? Is a transverter more than essentially a heterodyne stage that operates at high power?

Of course, you'd need to filter out the 27Mhz from the CB, and the 24?Mhz local osc from getting out on the air. That shouldn't be too hard.

BTW, does anyone know how to make the rn program stop asking me if I want to add new newsgroups? About once a week, the program makes me say "no" to something like a hundred groups. one at a time. *VERY ANNOYING!!!*
I consider this an annoying bug in this program. Or if it insists asking me, at least give me a menu to pick from, or say one "NO" to them all. NOT lots of NOs!

3463. Update on Phased Vertical Arrays (long)

Newsgroup: rec.ham-radio
Date: 1990-11-28 03:18:17 UTC
From: sawyer@twg.com
Message-ID: <8380@gollum.twg.com>
Source record: 6183

In response to the request for help in explaining some problems I was having in building a phased vertical array for 40 meters, I have received quite a large number of responses. It's amazing to me how many talented and knowledgable there are who obviously follow this group and will respond via email but have the good sense to stay out of some of the unresolvable debates. At any rate, the response I got was so great that I can see there's widespread interest in this topic. Hence this note is offered as something of an update on the topic and a consolidation of some of the suggestions I received.

First of all, I followed some of the initial advice I received and went back and retuned each of the two verticals to be resonant at the design frequency. Each was tuned in isolation of the other on a single 50 ohm cable. Next, I built a new phasing harness consisting of one 0.25 wavelength section and one 0.5 wavelength section of RG/11: 75 ohm stuff. I know that using multiple quarter-wave sections of 75 ohm cable will transform a 50 ohm load to a 100 ohm load. The two 100 ohm loads in parallel at the "T" connector then present 50 ohms to the feedline back to the transmitter. Without a good antenna noise bridge I'll never know for sure, but at least this brought the SWR down to around 1.25. Furthermore, it dipped in the vicinity of my design frequency (7025), so I treated this as absolutely good enough.

During actual use, it did show considerable gain in the general direction I wanted, but with some new anomalies. I have a second antenna I can use on 40 (a double Zepp cut for 160 and up) that provided a good reference point, since the broad side of the Zepp is in the target direction of the phased vertical array. The thing was absolute dynamite in the target direction--at least a full S unit, maybe more. What was curious was that the maximum gain seemed to be off counterclockwise (looking down) from the axis along the two verticals. It turned out to be a rotten idea for a contest: it put out a great signal to Japan (304 degrees from here), but was really poor toward Europe(at 25 degrees). Never again will I try to use a directional antenna I can't turn in a worldwide contest.

In the comments I received back, opinion seemed evenly divided between people (who seemed to me to be knowledgable sources) about whether the harness should be built from 50 ohm or 75 ohm cable. I used 75 and it worked, but there sure were a lot of people who said to use 50. (I once built a 2 meter array using 50 ohm cable, and it did fine.) Next, the point was made to me repeatedly about the effects of the mutual impedences of the two verticals. Common opinion was that the system needs to be tuned with an RF ammeter at the base of each to insure that each gets an equal current flow when connected in the phased array. Also suggested was using an antenna noise bridge at the base of each to get the feedpoint impedences the same when connected in the array. Tuning is accomplished by adjusting the lengths of the delay lines (notice how easy it is to say that, as opposed to actually doing it?) Several people made the point that

simply cutting the delay lines to the theoretical lengths will not result in a 90 degree phase shift. DL6RAI wrote to say that he had actually measured it at 70 degrees in one he had built this way. That computes with my experience of having the direction of maximum gain offset from what I expected. However, I'm at a loss to explain how you (a) tune the lengths to get equal impedances (or current flows); and (b) get a real 90 degree phase shift.

In summary, what came through is that the popular literature does a real disservice to this topic by oversimplifying it. It is, I'm sure, well understood in the broadcast industry. But too much has been deleted in translating this into the popular ham literature. For reference, I have been directed to Terman's "Radio Engineer's Handbook" and a 6 part series in Ham Radio Magazine circa 1983.

Hope this helps those interested in the topic. And many thanks to all who sent their suggestions.

3465. VLF Aircraft Radio Beacons

Newsgroup: rec.ham-radio
Date: 1990-11-28 05:56:38 UTC
From: charlie@oakhill.UUCP
Message-ID: <4251@radio.oakhill.UUCP>
Source record: 6363
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.electronics

Across the USA there are hundreds of VLF aircraft navigation beacons know as NDB's (non-directional beacons). They operate in the 200 KHz to 400 Khz range.

Does anybody know what output power NDB's utilize? I can hear the CW identifier from them as much as 200 miles away and I am trying to determine whether this is excellent reception or just typical. My antenna is a homemade 'active' whip which is about 10 feet long. I was told that NDB's are low power in order to minimize interference between beacons operating on the same frequency in different geographical locations.

Knowing the answer to this question will help me determine the effectivness of my active VLF whip. WWVB comes in so-so at 60 KHz.

Thanks in advance,
Charlie WB4HVD

3466. What is this radio?

I have inherited a handheld tranceiver from a technology
illiterate roommate, but I don't know what it is or if it is
useful! The only markings on it say:

General Electric
FCC ID AXA9MZTR-121A MPI SERIES
COMB: P5CRR56BEN

It is clearly a two channel handheld tranceiver, and has
volume and squelch knobs, and a "CG/OFF" switch.

What is it? What is it worth? Can it be modified to run
on Amateur frequencies?

The output power of NDBs vary widely. NDBs are divided into four classes:
1) HH - high power homing beacon, over 2 KW. These have a designated service
radius of 75 nautical miles at all altitudes.
2) H - medium power homing beacon, between 50 watts and 2 KW. 50 NM.
3) MH - low power homing beacon, less than 50 watts. 25 NM.
4) LOM/LMM - compass locator beacon. These are located at the outer marker
(LOM) or middle marker (LMM - these are rare) of an Instrument Landing
System. LOMs and LMMs have a service radius of 15 NM, though their power
output isn't specified in my reference.

Unfortunately, the only way to find out what class a given NDB is in is to
figure out where it is, and then look it up in the Airport/Facility Directory
for your area, available for $3 (I think) at your friendly neighborhood pilot
shop. The classes above are also described there.

I forgot to mention one thing: LOMs and LMMs have a 2-character ID, while the
others have a 3-character ID. Also, MHW-class beacons seem to be the most
common in a quick glance through my South Central A/FD.

Many of the repeaters in the Salt Lake City area have super coverage due to good height above average terrain (some in the 5000 to 7000 foot class). When the British THRUST land speed record team was making their attempts in '82 and '83 they were using the SLC repeaters successfully with 1 and 2 watt HTs. Some one else will have to check me on the distances from Dugway and the salt-flats but I think that its over 90 miles. One interesting repeater there is on Antelope Island in the middle of the Great Salt Lake, though not really tall it has an excelent window to the west and south west as well as covering much of the Wasatch front to Orem and the south side of Utah Lake.

The guys in Colorado should back me up on this one; the eastern slope of the Rocky Mtns also affords some fantastic repeater sites which could easily rival or surpass much of the coverage in the rest of the country owing to the uniquly level terrain to the east of Denver.

One suprising repeater is the one on Mt Washington (New Hampshire). Here in Portland, ME we are 90 miles distant and are still well covered by its service, there are places in Portland that are line of sight to Mt Washington. Indeed, the line of sight from Mt Washington extends well out into the ocean, I've seen it from whale watches where the distance was over 120 miles and, no, I didnot have an HT along to try though I am tempted next time.

Job Opening: Television Broadcast.
Please indicate where you saw this notice.

November 27, 1990

WLIO Television has an opening for a Television Maintenance Technician.
The applicant must have basic electronic skills as well as knowledge in
broadcast television equipment operation and repair

The applicant will be responsible for maintaining video and audio
systems, including audio tape cartridge and 3/4" U-matic tape, (soon to
switch to M-II), and associated equipment in television broadcasting.

The applicant must also have RF knowledge on UHF Television Transmitters, UHF
2-way, 2 gHz microwave/ENG truck, and general transmission techniques.
Computer knowledge and certification in radio service is preferred.

This position is full time with all normal benefits. All applicants to
this position should contact Frederick R. Vobbe, Chief Engineer of WLIO
Television, P.O. Box 1689, Lima, Ohio 45802. WLIO Television is an equal
opportunity employer.

Frederick R. Vobbe, Chief Engineer WLIO(TV)

> achieve that compliance with a minimum of physical labor.

Whoa! Where in Part 97 do you see a distinction drawn between real-time third-party traffic and store-and-forward? That's a distinction drawn by *you* rather than by the FCC. The paragraph addresses the means by which a third party may participate in stating the message. If a message (stated by a third party) comes across the network and is transmitted directly, without human intervention, that third party is stating it without the supervision of a control operator. Of course the control operator can use mechanical aids--I never said he couldn't--but the use of such aids doesn't absolve him of the responsibility to continously monitor and supervise the third party's participation.

The FCC's major concern is not that someone might say a naughty word on the air. They are concerned that unscrupulous people might use amateur frequencies for business or criminal purposes without there being any means of detecting and tracking them. That is the basis of having third-party rules at all, really. When we went down to the FCC a few months ago to brief them on packet developments, most of their questions had to do with how one could detect the presence of illegal

traffic and trace it back to its source.

If people decide en masse that "it's better to beg forgiveness than to ask permission," and they start installing Internet<->packet gateways willy nilly, I predict that the eventual result will be a tightening of the rules to prohibit third-party digital connections generally. No one wants that.

Hi all,

I'm interested in Kenwood's R-5000 receiver and now wonder whether anyone in the net has some experience about it? According to specifications, it seems pretty sensitive on shortwaves but how about mediumwaves? And the audio quality is reportedly better than e.g. in Icom R71. Any comments on its performance?

Please post or drop me e-mail,

Thank you!

Yours,

Jari.

You didn't mention what frequencies you're using? If you're talking
the Ham Bands (I assume) then you're in violation of FCC Regulations using the
repeater for business uses! If you are talking Business use frequencies, then
you will have to talk to someone in the know at your local FCC office.

{
{I am back with the results from my battle with alinco. For those who have
{seen this before and are familiar with my quest the new info is on the last
{page of this posting. For those who are not familiar read on. For those
{who don't care oh well . . . .

I also bought one of these and care very much! I agree with your assesment of the rig BTW, it is a good buy despite the deficiencies. THe detachable control head should be a really neat feature if I ever get it installed in my car (it was installed for a day and then the UHF started to howl with the volume up high - now waiting on warranty repair!)

{If you ask them (nicely) there are (a few) dudes at Alinco that are willing
{to help and are smart enought to be helpfull (there is a differance ;-}).
{They can fax you the information or even send it to you next day air at no
{charge if you ask politely or are VERY persistant (as in my case).

I have found their staff very willing to help, but lacking in support from head office. Like the $10 service manual that still hasn't appeared - I would really love to get a copy!

{Now the big news . . . to modify the rig to xmit out of band (to call the
{cops etc ;-}), to operate as a cross band remote, etc. follow these easy
{steps.

[modification steps deleted]

{This is what you will find . . .
{The rig now transmits everywhere.

This I do NOT consider a virtue, if I want to transmit out of band I want to KNOW that I am doing it! I have caught myself twice now replying to a VHF repeater on the UHF state police frequency. They use PL and I cought it after getting only "Alpha Alpha OOOPS" out, but that is still not something I like to do! All to easy in city traffic though.

{it now will display (not receive) 800Mhz band and 300Mhz band on the 440
{side of the display in rotation (press the uhf switch to switch from band
{to band)
{It will now display (not recieve) the aircraft band (yes it does indicate
{AM) on the 2 meter side of the rig. There is no AM detector presently but
{I am working on it.

I would love to see this whenever you figure it out. My ICOM 24AT actually DOES receive ALL of these, so it should be doable. Transmit probably WON'T

work, but that's really not something I want (see above).

{Cross band operation:

I too plan to get a 45 Watt handhel this way. Only problem is that you
can't transmit until the repeater/other station drops their carrier. There
is no way (that I know of) to disable the full duplex!

Personally I find the handheld receiver works fine and would like to have
just a ONE WAY (VHF to UHF or UHF to VHF) as an option.

I find this is annoying with the dual band function too, it would be nice
to have the option to AUTOMATICALLY mute the "other" receiver. It can be
done mmanually, but I have other things to do on the freeway. ("FIRST fly
the plane/drive the car!")

{I am a bit miffed that Alinco didn't see this through. They could have created
{the all time worlds greatest mobile rig that would allow one to access it
{via 440 and then work any of your favorite 2 meter repeters operating as
{a remote base.

I agree, but hopefully hams can find mods/methods to accomplish 99% of
these.

{They even saw fit include a dtmf function that allows you
{to remote key the transmitter (rather than running as a repeater). This
{in conjunction with the other functions that are 1/2 implemented certainly
{say something about Alinco.

Is this the "remote base" function that I mentioned above?

{Counter point
{It is still a great radio and I would buy it again still knowing what I know
{now. The only differance is that I wouldn't be as disappointed when I found
{out that the rig doesn't "really" do all that Alinco says it can do.
{
{Any way I hope you enjoy your rig as much as I enjoy mine.
{
So far I sure have! Even if I had to return it for repair. It would be nice
if they bought an IC24AT and studied the manual :-) ICOM seems to do a MUCH
better job of "thinking through" their operating procedures. Possibly this
is related to the size of the company, but ...

Any more DR590 user out there with neat ideas?

*Mike Waters AA4MW/7 waters@dover.sps.mot.com *

There is no right way to do wrong.

>I'm interested in Kenwood's R-5000 receiver and now wonder whether anyone
>in the net has some experience about it?

I've had one for a few weeks. I've been playing with it (and translating the manual from Japanish to English so I can figure out how it works) and slowly putting it through its paces. It's an impressive receiver with a lot of flexibility. The controls are fairly intuitive (with glitches here and there).

I upgraded to this from a 2010, and it's attached to an Eavesdropper antenna outside. The differences, as much as I like the Sony, are astounding (which is not a put down of the Sony -- the R5000 costs a LOT more and so it better outperform).

>According to specifications, it
>seems pretty sensitive on shortwaves but how about mediumwaves? And the

It's very good on shortwave. I've done very little DXing on MW so far (no time), but I can, for instance, pull in XTRA (690, Tijunana) some of the time even though KNBR is sitting about 30 miles north blasting out 50K Watts on 680. Between some playing with the filters and some off-band tuning, I can almost make the splatter from the local powerhouse go away. I think once i have a chance to sit down and do some serious MW stuff, it'll perform fine.

Nice toy. Nice performance. I'm impressed.

|> Steve - W3GRG
|> mosier@uncg.bitnet
|>
The quarter wave perpendicular drop is "ideal". Ideal and reality
are often quite different. I'd suggest running where it's convenient
keeping an eye on what's "ideal". I.E. Run it to the shack all the
way with the open line and keep it off the ground and preferably out
of your and your kids way.

If you really want to go to coax, be sure you use a very high quality
coax as you'll have high SWRs and accompanying losses on it. The quarter
wave stub matching to coax will only work well on the lowest frequency it's
cut for anyway.

My $5.00 worth is to run the ladderline the whole way, to keep it off
of the ground, and out of your way. It'll work great - mine does!

Mod number 1: I need to defeat the 2 second delay 'feature' which allows
use of the DTMF keys without having to hold the PTT in.
This little "feature" is a pain in the rear if one is
trying to listen to the confirming telemetry when
controlling links. I've heard that there is either a diode
or resistor in the mic which gets clipped to do this but
wud like specifics before cutting :-)

Mod number 2: Has anyone ever figured out a way to get 'sidetone'
feedback when using the DTMF keys on this rig or similar?
IMO audible feedback would be a very desirable feature
when using the keypad. Especially with the crummy keys
that are on the new mic that Kenwood sells with the 731A
and similar sets.

Thanks in advance...

I am the Vice President of the Delta Amateur Radio Club here in
Memphis, TN. We have about 300 members in our club who use our three
repeaters. We have a RC-85 controller from ACC which controls our 2m and 220
linked repeater system. We have a S-com 5K controller on our 440 repeater. The
main project for the coming year is to upgrade the RC-85 controller. The
obvious choice was to go for a RC-850 controller. I would be interested to hear
about any comments from control operators, programmers, or even users of the 850
controller. I would specially be interested in any problems, software or
hardware with the RC-850.

Bruce,

We enjoyed your thread on phased verticals too! Thanks for the followup posting.

Did you consider switching in another phasing loop to turn the beam? You should be able to change the beam direction from end to broadside by a 90 degree phase shift.

Can I operate your station during the ARRL DX CW? <grin>

From: techpubs@PRC.Unisys.COM
Subject: RE: Antenna Matching

I have a friend who ran a setup very similar to what you describe for years. Brought the twin lead down the side of the house to the second floor (well under a 1/4 wave, probably under an 1/8 wave also in twin lead length), fed the twin lead in through two holes cut in the wood window footing through two porcelan feed throughs, and right to his transmatch (which probably had a built in balun). Always worked ok and never had any problems. I would avoid going to the ground and then runing up just to get a 1/4 wave feed length. Also, I think it probably advisable to keep the balun right at the transmitter location in this case. You should watch for high RF levels in the shack (eg, mike burn, rf feedback, etc), and avoid sharp bends with the twin lead.

From: halbert@crl.dec.com
Subject: RE: Antenna Matching

Here's some advice, for what it's worth.

The "drop perpendicularly away from the antenna for at least a quarter wavelength" is not so critical. The main point is that the feedline may couple to the antenna if it ends up parallel or approximately so to the antenna. This may or may not produce RF in the shack. It may just distort the antenna pattern, and you probably wouldn't notice that anyway. The feedline length will also have some effect on how easily the antenna tunes up, but that's not predictable.

At first, just try enough feedline to get to your tuner. If things seem hot with RF in the shack, splice in some more. As a last resort you could try sticking the extra length out the window in the "big drip loop" configuration you described.

Supposedly you shouldn't turn really sharp corners with open-wire. Don't pile it up on itself, of course. Also, you supposedly shouldn't run it near metal, but I've run it near (insulated by some plexiglass) metal window frames with 100W, and not had any problem. Currently I run 300 ohm from my shack into the attic, through a plastic Radio Shack thru-the-wall antenna coupler, through my aluminum siding (!), where it connects to 450 ohm line outside, and haven't had any trouble. I use ladder line outside instead of just 300 ohm twinlead, because twinlead is supposedly affected a lot by rain, snow, etc.

A balun isn't really necessary, and won't actually work very well if it's looking into some messy or high impedance. I have a horizontal full-wave 40m loop, and use a balun just after the tuner so it will tune up more easily, but a loop doesn't have such wild impedance swings on different frequencies as a dipole.

Basically, just try something; it's not critical.

Regards,
--Dan, KB1RT

==========

From: sawyer@TWG.COM

Re your plan to put up a double Zepp...I would be interested in what kinds of feedback you receive to your posting. I have a double Zepp I put up for 160 and up which is 253 feet long and roughly 150 feet up at the feedpoint. It uses exactly the same feedline you are going to use. This thing runs from my tribander mast over a valley to a tree on the next ridge line. I just draped the feedline from the feedpoint through a catenary back to my shack, which is about 50 feet from the mast. Thus the feedline doesn't leave the Zepp at right angles at all--it's more like 60 degrees or so. I was careful to let the feedline have no sharp bends, and it goes straight to the transmatch when it comes into the house. I was also careful to keep it 6" away from any metal--like the gutters and the door frame. It works great on all bands. There are times it even beats my tribander on 20/15/10 (a HyGain Explorer 14). However, if you pick up something via the net that would show me how to improve it even more, I'd sure be interested. Thanks in advance.

==========

From: DERRY@ROSEVC.Rose-Hulman.Edu
Subject: Zepp (pedeedoodah)

Steve, You are describing MY antenna. It's 35 feet in the air and is 131 feet long. I use it on all bands from 160 (fed as a Marconi antenna) up to 6 meters.

Don't get too uptight about all the restraints. My feedline (it's 300 Ohm foam TV twinlead) angles from the center of the Zepp over to my house wall where I have a nail and some nylon cord. Then it runs along the wall for a few feet then in through the 2 x 6 to a crawlspace. Its then runs through

the crawl space through another 2 x 6 into my basement, where the shack is.

You're on the second floor. So just run the feedline as directly as possible to your shack. Don't make bends so short it will kink it. It's ok for it to run near metallic objects but don't let it lay to close to any such object for any significant distance.

My advice is run the feedline like it was coax to the transmatch. Then using plastic tape, string and thumbtacks, kind of dress it away from any long runs near metal stuff. Near means 4 or 5 inches for the type of transmission line you are using.

I once had all the questions you have running through my head, then I worked a guy on 40 m using "our" antenna. I raised the same questions as you have in your query. He said, "Don't worry about it."

There is nothing important about having 1/4 wavelength of line. Shorter is better. You may find some bands where your tuner is kind of hinky. But eventually you'll find the right settings for each band. I use a MFJ-941.

Incidentally, if it's resonant on 7.1 MHz, then its other resonant frequencies are: 14.2, 21.3, and 28.4 MHz.

I made mine 131.8 feet long. It's resonant at: 3.55, 7.1, 10.65, 14.2, 17.75, 21.3, 24.85, and 28.4 MHz. In or very near all the hf bands. But 132 feet is a bunch.

The G5RV is an antenna for folks who don't really believe in the center fed Zepp. I don't think you need it. Read about it in the ARRL antcompendium. It requires 30 feet of parallel wire line then 68 feet of coax. I can't figure out why the 68 feet, not has anyone been able to explain it to me.

If you're really in a bind about running the twin lead through walls etc, ARRL Antenna Book suggests TWO pieces of coax from the Transmatch to the point where the twin lead is in the clear. At the Transmatch use each center conductor as parallel line and ground both shields. But where you connect the twin lead to the coax, DO NOT GROUND THE SHIELDS.

This is a neat trick, but in my setup I've never had to use it.

Let me know how this works out. I'll listen for you on 40 m. I'm on quite a lot.

Traditionally, the first Electronics Flea Market of the year is in March. Being an outdoor event, the partipants take their chances on the weather.

For the benefit of those who may not be familiar with this event, a group of Amateur Radio Clubs in the region south of San Francisco conduct a flea market in the parking lot of Foothill Jr. College in Los Altos Hills the second Saturday of each month during the spring and summer. Admission is free buyers. Sellers pay something like $10. Of course, if you find a "bargain", you might spend more! Come early! Most of the sellers are packed up by noon.

Just in case anyone really wants to try to DX these things, the compass locators (with the two-character ID) follow a naming pattern that would help you figure out where they are if you have access to a mapping between airport locations and their three-letter identifiers (one such is available by anonymous ftp from uxc.cso.uiuc.edu in pub/nws-city-ids.Z.

LOM's id with the first two letters of the airport identifier that is being served by the marker; LMM's id with the last two. For instance, here in Champaign IL, the airport identifier is CMI, so the LOM id's as "CM". If we had a LMM (we don't), it would id as "MI".

3488. Re: Cheap Loop Antenna for HF

Newsgroup: rec.ham-radio
Date: 1990-11-28 23:20:19 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880374@hpfcdc.HP.COM>
Source record: 6185

After using the Loop some more, it appears to be an outstanding low-band antenna, compared to my HF6VX on the ground. The Loop seems to get 1 or 2 more S-units, and the audio is perceptably louder (the "audio test" is the proof of any antenna :).

This might be due to my not having an adequate groundplane for the lower bands - 32 radials ranging from 15-30' each, all property-limited. The groundplane is near perfect for 10/15/20. The HF6VX is a 1/2-wave on 20, 1/4-wave(?) on 15, Awfully Darn Long on 10, so it has gain over a simple 1/4 wave trap vertical.

Compared to the work of laying all those radials, the Loop Skywire is several orders of magnitude easier to install.

Perry / KF0CA

> The book says the wire should "drop" at least a quarter wavelength ...
The situation the book writers had in mind was an antenna high in the air. I would think it best to bring the feed wire at right angles to the antenna, but at an angle to the height of the radio room. It would be very convenient, if "right angles" happened to line up with the window!

The question was also raised about metal objects near the feedline. Old rules of thumb suggest maintaining a spacing several times the distance between the wires. Crossing a metal window frame at right angles is not as much a problem as running parallel to a metal object.

Caravaning is one of the best applications for 2-way communication. The biggest advantage of CB is that everyone can use it. The biggest disadvantage is that everyone can use it, like the multi-kilowatters near the Gulf of Mexico. Hello, Skipland, as it were.

Three other hams and I drove three separate vehicles to Lake Powell, some 12 hours from here. I had never been there before. In spite of leaving at different times, we all arrived at the appointed time and general vicinity, and were able to use 2m to coordinate finding each other and loading the week's provisions. It worked so well, Murphy never had a chance.

>It also says that the feed line should drop
>perpendicularly away from the antenna for at least a quarter wavelength. My
>question is what to do with it after that.

The intent here is to keep common-mode RF off the feedline. Since your
transmitter is going to be in the antenna's field in a major way, I don't
think you can avoid it. It might be better from a safety standpoint to
move the shack down to the first floor.

>There is a well-advertised commercial antenna (is
>it a G5RB dipole or something like that?) that drops balanced line for quite a
>way into a "black box" with coax out. What sort of a balun is that?

I think it just connects the line to the coax. The G5RV has some
interesting matching problems, since some of the harmonics are end-fed
half-waves out of phase, which have K-ohm impedances. All the G5RV
designs I've seen don't use baluns.

>Never
>having used balanced line before, I'm a little uncertain of what I can do with
>it, namely where I can run it, what kind of corners I can turn, etc. (As a
>starter, I'm using that real wide stuff that looks like TV twin lead with
>alternating patches of the center plastic cut out. After I learn to handle
>that, I though I would look for some of the open wire with discrete spacers.)

I've used this stuff, and the rule appears to be "Keep it away from long
runs of metal parallel to the line."

3494. CW Questions from a novice

Newsgroup: rec.ham-radio
Date: 1990-11-29 03:35:24 UTC
From: randall@informix.com
Message-ID: <1990Nov29.033524.23715@informix.com>
Source record: 6198

I have been a ham for 8 months, and have upgraded to advanced class. Would you believe that I've never made a CW QSO? I really would like to get involved in CW, but I feel like a complete ignoramus. I have an ICOM-735 with the built-in keyer. I have these questions:

1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him, but how? What do I send? Like I say, I'm pretty ignorant.

2) On what frequency do I answer the CQ? If I hear him, do I answer him on that frequency, or do I move the dial until his tone is at the lowest point?

3) Which bands would you recommend for a beginner? Obviously, the novice sections of the bands are good. I like 40 meters, but broadcast stations usually obliterate the band.

Thank you in advance for any help.

Do what I do... I program all NON-ham repeater pairs with the offset in
the opposite direction (but by the correct amount). In the case of repeater
outputs in the 450-455 MHz range, you would be transmitting in the ham band.

Hi folks,
Last weekend I got in a bit of ham-radio work while doing my
AFF Stage 3 jump (well, _after_ the chute opened at least),
at the Newcastle Sport Parachute Club, Elderslie NSW.
I've put the question about on voice and packet but had no
definitive answer yet to the following question.
Has this been done before, specifically in Australia? I expect
it's common enough in the U.S., and I've had hints that somebody
did it in Melbourne a few years ago, but I'd like to know for sure.
Any ideas anybody?

Thanks,
Richard.

[I posted this on 11/16 and 11/26 but it apparantly never get outside Houston. Sorry if you see this twice. --GaryM]

A new launch date has been set for STS-35, Sunday, December 2, 1990 at 0628 UTC. New keplerian elements have been generated and are included below.

The shift timeline for the flight has been changed significantly. A night landing has been approved. This allowed the work shifts to be rescheduled for a 24 hour day instead of the previous 23 hour (approx) day they were using. The 23 hour day was used so that the crew sleep times were shifted away from the deorbit/landing time.

Below are summaries of various bulletins that have appeared about the STS-35 SAREX flight. I've also included a timeline showing when the Ron (WA4SIR) will be operating SAREX and when the SAREX packet robot will be running.

--GaryM

==========

Mission Audio Rebroadcast

The following stations will rebroadcast the mission audio from the
shuttle and ground controllers.

WA3NAN - Goddard Space Flight Center (GSFC), Greenbelt, Maryland.
W5RRR - Johnson Space Center (JSC), Houston, Texas
W6VIO - Jet Propulsion Laboratory (JPL), Pasadena, California.
W6FXN - Los Angeles
K6MF - San Francisco

Station	VHF	10m	15m	20m	40m	80m
WA3NAN	147.46	28.650	21.395	14.295	7.185	3.860
W5RRR	146.64					
W6VIO	224.04	21.280	14.282	7.165	3.840	
W6FXN	145.46					
K6MF	145.58	7.165	3.840			

==========

W5RRR Special Event Station

W5RRR - Johnson Space Center (JSC) ARC, Houston, TX. Special event
station with bulletins, updated element sets, and current flight
information will be making contacts and answering questions using SSB on
the HF bands. The frequencies are in the chart below. The special
event station will start operations on morning of the day after launch
(currently 1500 UCT 12/03/90) up thru the landing. W5RRR will also
rebroadcast the audio from the contacts between WA4SIR and schools.
Three of the 5 bands will be in use at any given time, with band
selection determined by propagation.

Station	10m	15m	20m	40m	80m
W5RRR	28.400	21.350	14.280	7.227	3.850 (+/- QRM)

==========

W1AW Voice Bulletins

W1AW will be broadcasting daily bulletins with updated information on SAREX during the flight. Voice bulletins are transmitted daily at 0130 UTC and 0430 UTC on the following frequencies:

Station	10m	15m	20m	40m	80m
W1AW	28.590	21.390	14.290	7.290	3.990

==========

AMSAT Net Operations

Information will also be available from the AMSAT net, tune in for bulletins. The net operates every week on:
Sunday 1800-2100 UCT (international) 14.282 Mhz USB
Tuesday 0130-0300 UCT (USA) 3.840 Mhz LSB

==========

JSC INFO BBS

The Public Affairs Office at the Johnson Space Center operates a BBS to provide information to the public. Check this board for updates to the keplerian element sets during the flight.

To access the BBS, call +1-713-483-2500 using 1200 baud, 8-N-1, at the ENTER NUMBER: prompt, enter "62511" and you will be connected to the BBS.

NASA JSC's Electronic Space Information BBS is intended to provide 24-hour access to biographies of NASA officials and astronauts, news releases, space flight mission presskits and television schedules, space shuttle systems information, flight manifests and schedules, and other information about the space program.

==========

TNC Settings for SAREX

The packet call sign on board the shuttle is WA4SIR (SSID=0). Your TNC should be in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations. Your FRACK should be at least 3 seconds. If everybody runs the same DWAIT then everybody will be transmitting at the same time. When uplink QRM is heavy pick a DWAIT that nobody else is using. The FUDtimer on the ROBOT is set for 3 seconds.

[condensed from ANS-230.05/06, originally compiled by W3IWI]

==========

NASA Select Video Broadcast

STS-35/ASTRO-1 Space Shuttle mission television programming will be transmitted daily via the following satellite to accommodate the Alaska and Hawaii audiences:

SPACENET 1
Transponder 17
120 degrees West Long
4040 MHz (Video)
6.8 MHz (Audio)

The continental United States will continue to receive NASA Select television, 24 hours a day throughout the mission, via:

SATCOM F2R (C Band)
Transponder 13
72 degrees West Long
3960 MHz (Video)
6.8 MHZ (Audio)

[condensed from ANS-244.03 by N5QWC]

==========

SAREX Uplink/Downlink Frequencies

Downlink/Uplink Frequencies for Voice QSOs to be used on Upcoming Mission

Get out your HTs and HT programming manuals. You will want to program your 2 meter FM transceivers with the following information.

Shuttle Shuttle
TX Freq RX Freq
-+-+-+

accomplished by Hams using standard FM transceivers. If Ron finds that the receive QRM becomes unmanageable, he may listen on the alternate frequencies listed. In North America, the lower section of the FM repeater bandplan extends as high as 144.90. This is why the uplink frequencies only extend down to 144.91 MHz.

There will be no simplex operation with SAREX on either voice or packet. Although packeteers are not accustomed to operation with a TX/RX offset, in this case, it is the only way to connect to SAREX. If you transmit on 145.55 MHz the only people who will hear you are those other Hams in your area trying to contact SAREX (You will most likely become an instant celebrity, but not necessarily in the positive sense of the word!).

There should be about 3 KHz of Doppler shift due to the orbital velocity of the Columbia spacecraft. By limiting the deviation of your transmitter to 3 KHz, Ron's receiver should have little trouble capturing your signal.

[This information was extracted from an article written by W3IWI, WA4SIR, and W3XO and published in the March 1990 issue of The AMSAT Journal]

SAREX Packet Operating Hints

HR AMSAT NEWS SERVICE BULLETIN 230.05 FROM AMSAT HQ
HR AMSAT NEWS SERVICE BULLETIN 230.06 FROM AMSAT HQ
SILVER SPRING, MD AUGUST 18, 1990
TO ALL RADIO AMATEURS BT

You learn very quickly when venturing into the world of Packet Radio that unless you use the correct call sign when attempting to connect to another packet station, you won't get too far. Such is the case with the packet operation on SAREX. A number of publications reported earlier this year that the SSID for the SAREX packet ROBOT would be = 1 (ie: WA4SIR-1). Tom Clark, W3IWI, reports that both the HK21 ROBOT TNC and the operational software for the GRID laptop computer have the calls defaulted to WA4SIR (SSID = 0) and that call should be used unless, for some unanticipated reason, the defaults are overridden. Tom continues, the best advice is for you to MONITOR the downlink signals from STS-35 and use whatever call you see on the downlink.

The ROBOT TNC code uses only one SSID at a time.

Because the WA4SIR SAREX ROBOT will be bombarded with signals from tens or hundreds of ground-based users when STS-35 is flying over populated areas, it is not possible for the ROBOT TNC and radio to use normal half-duplex packet procedures -- the CD (carrier detect) signal will simply never drop! The ROBOT will be running in a modified full-duplex mode. When the ROBOT copies a valid packet frame (or when it is time to send a beacon), the data to be sent is put into a buffer and a timer (which is called the FUDtimer) is started. The ROBOT firmware then queues all other outgoing transmissions in the buffer until FUDtimer expires (3 seconds later), and all downlink frames in the queue are sent in one long transmission. You may discover that the response time while running in this mode is sluggish when compared to normal packet

operation.

Since the SAREX handheld radio cannot receive when it is transmitting, users should insure that they remain silent and listen when the shuttle is transmitting. In other words, DO NOT RUN FULL DUPLEX ON THE GROUND! Leave your TNC in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations.

You should be careful with the setting of two of your TNC's timers: DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and ACKs are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the same time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using! (sort of like picking a lottery number!)

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the ROBOT's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long do I wait?) parameters and the need to stop transmitting so you can hear a reply are just like you encounter when working a DXpedition pileup on HF. If the DX station has a pattern of listening for a few seconds (=FUDtimer) before transmitting, you may have better luck being the LAST station they hear, after the din dies down. The differences are that (1) the ROBOT is a computer and is very predictable and (2) the ROBOT can be working several stations at one time.

[ANS thanks W3IWI for compiling the information for this bulletin]

3499. Re: AMSAT orbital data format

Newsgroup: rec.ham-radio
Date: 1990-11-29 09:17:35 UTC
From: fpa@qualcomm.com
Message-ID: <1990Nov29.091735.27641@qualcomm.com>
Source record: 6205

LSPRINGSTEEN@WSMR-SIMTEL20.ARMY.MIL (Larry L. Springstee) writes:
>RE:AMSAT ELEMENT SETS
>
> I have been wondering WHY the good people at AMSAT insists on publishing
>orbital element data in an archaic and expanded format. I have been relaying

The reason is that the AMSAT-format is human-readable. The variety of different tracking methods & programs being used by amateur radio and other hobbyists is amazing. Some folks, for example, use hand-held calculators. Many of these programs cannot handle automated input, hence human-readable format is most desirable. I'm not trying to justify the use of old software, just stating the facts.

>I do not understand
>the logic of sending data that takes up twice the space and requires manual
>input to be used. ^^^^^^^^ ^^^^^^
^^^^^
That's not exactly right. Many programs can read the AMSAT-format automatically. If your software doesn't, then i suggest you obtain InstantTrack (which i wrote). Available from AMSAT for a small donation. Nobody should _ever_ be forced to type in long streams of digits. Computers are supposed to be labor-saving devices!

> It's the same data only in half the space. Is there any one that
>reads this net that knows who to talk to to fix this problem? I see this

Yes. AMSAT has now assigned someone to manage the distribution of orbital element info. He is: Dick Campbell, N3FKV. He's the official person to whom you should send your concerns and suggestions re AMSAT's orbital element distribution.

3500. Re: Antenna Matching

Newsgroup: rec.ham-radio
Date: 1990-11-29 11:26:30 UTC
From: dstock@hpqmole.sqf.hp.com
Message-ID: <410012@hpqmole.sqf.hp.com>
Source record: 6206

If I remember rightly the bottom end of the G5RV was designed to
come our at about 75 ohms. The original design just connects the bottom
end of the OPEN WIRE feeder to the co-ax - no balun.

Louis varney G5RV himself recommends an ATU design with a true balanced
output and no balun. He seems to get asked frequently about this and
so re-publishes details every now and then. There was a fairly
comprehensive article by him on this subject in RADCOM within the past
couple of years. These antennas are definately compromise jobs, but do
well for what they are. Don't expect low VSWR, if you can use all balanced
feed line and balanced ATU. If you get a very bad match at any frequency
of importance, you can shift it by changing feeder length.

Quite a number of QRPers use them and with patience and a couple of watts
manage to embarrass the kilowatt gang occasionally.

I ran a G5RV for 5 years, used slotted ribbon feeder. Nothing else
that would not cause planning trouble would do as well, Im just using a
40M specific antenna at the moment. There is the ARRL wire antenna book
and SPRAT often carries wire antenna/ATU info.

Hope this helps All my own, finest opinions :-)

3506. Re: ic751a vs ic751 microcode problems

Newsgroup: rec.ham-radio
Date: 1990-11-29 17:07:24 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <4630020@hpspkla.spk.hp.com>
Source record: 6211

Strictly speaking, the microprocessor code is permanent in the 751. All that is actually in the battery backed RAM board is data used by that code. The RAM contains the frequencies that define the band edges of the ham bands. It is in BCD form in the lower 256 bytes of the 1KX4 RAM. When the processor determines that the RAM is corrupt it just goes out to lunch to prevent out-of-band transmission.

I think ICOM should have mentioned the RAM feature in the manual (I have an IC-751 and there is no mention at all of the future loss of function.) Another thing that should be in there is instructions on how to remove the RAM board from the radio (without static damage) so that it alone can be shipped to ICOM for re-programming when the battery fails. It seems silly to have to ship the whole radio when it isn't really necessary.

When I first discovered the RAM feature of the ICOM radios I got a schematic of the RAM board from ICOM and figured out how to re-program it myself so that when the battery does go I would be covered. I would consider writing an article for QST with perhaps a schematic for a board that would interface to a PC via RS232 which would allow re-programming any of the RAM boards if there is any interest. Another thing that puzzles me is why someone, ICOM or someone else, hasn't come out with a replacement board with ROM providing the frequency data and RAM for the memories, vfo's etc. It seems like that would be easy and would make everyone happy.

Someone posted some info on mods for the Kenwood TH77A handheld
in this group but it was deleted before I could print it.

I am buying one shortly and would appreciate any information on
modifications.

Please send to PPDDC@uwocc1.uwo.ca

Thanks very much.

Source record: 6215

The KC4SW 52.64 machine, atop Black Mountain (2820' ASL) has coverage extending from the Santa Cruz mountains to Western Nevada, and about equal coverage North and West out over the Pacific.

N9EGR in Milwaukee covers most of Northern Illinois, Southern Wisconsin, and Michigan..

> As a point of trivia, I've been wondering which single ham repeater has
> the largest coverage area accessable with ordinary equipment. This
>

Well a lo tof people there days have multimode rigs for VHF so I would
say this is pretty ordinary equipment. Since I am closing in on DXCC
on AO-13, I claim it has by FAR the best coverage ;-).

In the northern latitudes we are rapidly approaching 20+ hour days on
AO-13 as a matter of course. At my latitude, 10 days out of 18 are
20+ hour days and this will increase. 20 hours of coverage of the globe.
We're pretty proud of this. Come join us.

Dave:

It is still in pretty rough shape. We are fixing bugs in it as I write this. We finally have it partially working with AEA tnc's. There is some problem with the way hardware handshaking is done in these units or in everybody elses unit. Also, AEA gives a much higher priority to commands than does anyone else. So when the latest version of the bulletin receiver code puts the TNC into kiss mode, since some of them must be followed by restart command, this is generic to the program. Because of AEA's higher priority to commands (user input really), the TNC stops processing the KISS ON command and immediately gives the foreground over to the new incoming command. When it is done receiving it, it sees that it is the second highest priority command (restart) and restarts the tnc without having EVER put the thing into kiss mode. This needs a 1 second delay added to overcome this problem (much less really but Unix time is given inside in 1 second blocks and is transportable across most systems). We are working as fast as volunteers can.

On DOVE:

Please contact G3ZCZ (lives in Md.) at N4QQ. His What's-Up program is the best in the business for decoding satellite telemetry for many birds INCLUDING DOVE. I strongly recommend it over either the one NK6K or I wrote for the Microsats.

> directory pub/SPACE and are in files such as ss11.26.90 (which means
> shuttle status for 11/26/90). There are so many files in this directory

NASA also maintains a dialup-bbs with this info. They call it
Spacelink. It's geared toward schoolteachers and has a lot of
classroom activities and the like, but there are a lot of other neat
things to be found. They have some programs for Apple IIs, Macs, and
MSdos machines. They also have some GIF files from Voyager and Hubble.
The Hubble shot of Saturn is great!

Anyhow the phone number is 205.895.0028. There is a short registration
to go thru and you're on. Its a menu driven system, and they have X
and Ymodem download.

Have fun!

The classic favorite mode B amplifier is the Mirage/KLM D1010N. It's a linear 10 watt in 100 watt out amp. See the usual ham rags for the best price. Typically around $300.

From: jws@hpfcso.HP.COM
Message-ID: <7500051@hpfcso.HP.COM>
Source record: 6221

Yes, 902-928 MHz is a ham band in most of the country as a secondary allocation. However, part 15 low-power devices such as wireless lans, VCR "repeaters", etc. are now allowed. They must not interfere with higher priority users and must accept any interference. (Yeah, right -- try telling that to the business next door when your rig wipes out their wireless lan.)

PETITION (Addendum to Petition for Rulemaking, Docket # _____________)

To: The Honorable Commissioners of the Federal Communications Commission
1919 M Street N.W.
Washington, D.C. 20554
Date: ___________________
WE THE UNDERSIGNED hereby find:

--that during conditions of impaired visibility such as HEAVY FOG
or blowing dust, in addition to excessive speed, absence of adequate
information about the roadway ahead is a cause of regular, predictable
massive vehicle pileups with great injury and loss of life,

--that Citizens Band Radio holds the possibility for reducing that
toll by delivering timely information about roadway conditions,

--that lack of information about roadway conditions ahead in
general contributes to much congestion, waste of time, excess consumption
of fuel, and air pollution which could be avoided if drivers knew to
take alternate routes,

--that the existing chaotic, conflicting usage of all CB channels
other than Emergency Channel 9 prevents an organized effort to exchange
such roadway condition information,

--that Emergency Channel 9 usage is limited to emergency information,
excluding information that might prevent such emergencies in the first place,

THEREFORE, we the undersigned hereby support the Petition received
September 11, 1990, FCC Docket # _______, petitioning the FCC to designate
one of the existing Citizens' Band Radio channels as a "Traffic Advisory"
channel with usage limited to warnings, advice, comments, questions, and
answers about roadway conditions, and with enforcement provisions similar
to those of the Channel 9 Emergency Channel but less restrictive.

```

As promised, I filed my petition with the FCC which they received on September 11 and promptly sent to the Private Radio Bureau where it sits on a stack of 20, first come, first serve. The word from them is that it's a year away from being assigned a docket number. Since we're talking public safety, I am displeased by the delay.

The petition itself is about 3/4 of an inch thick but I will send one to anybody who wants one. Above is a short form of it. There are enough of these out and around in this area for about 8,000 signatures. Most of them are in the hands of various REACT teams. I have a troff version I can send you if you like.

Last week the Manteca City Council unanimously approved a resolution with essentially the same language. I will post or send that also if anyone wishes. I've thrown together a 40" by 60" collage of multi-vehicle fog pileup news photos and news stories for public presentations and, along with several other members of Ripon REACT Team #4777 (which I've joined), I'm taking it to various City Councils and Boards of Supervisors up and down the Central Valley to request similar resolutions. The collage is quite effective. Let me know if you would like to cooperate on making such a presentation in your city and I'll see what I can do.

What I would like to do is keep a steady stream of these petitions flowing into the FCC so that by the time they get to it they will see that it has overwhelming support. If you support this concept, please bury the FCC with signatures.

Thank you.
--Mike Barkley

3517. Re: CW Questions from a novice

Newsgroup: rec.ham-radio
Date: 1990-11-29 20:54:52 UTC
From: mojo@netcom.UUCP
Message-ID: <17730@netcom.UUCP>
Source record: 6223

randall@informix.com (Randall Rhea) writes:
>I have been a ham for 8 months, and have upgraded to advanced class. Would
>you believe that I've never made a CW QSO?

Yes I would! Congratulations by the way, and I hope you enjoy trying CW.

Before answering specific questions, let me refer you to the article in
December QST called "Your Novice Accent." It may answer your questions
more completely. You'll also learn the most simply by listening.

>1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
>but how? What do I send? Like I say, I'm pretty ignorant.

Say I call CQ like this (typical): CQ CQ CQ DE AA4KB AA4KB AA4KB K

--
You answer like this: AA4KB DE KK6MY KK6MY AR
(The AR is a prosign, sent run together, no space between. didahdidahdit.)

>2) On what frequency do I answer the CQ? If I hear him, do I answer him on
>that frequency, or do I move the dial until his tone is at the lowest point?

You want to answer him on the frequency he's using. That's tricky on a
transceiver. His frequency is your dial reading plus (or minus) the audio
note you're listening to. The audio note is generated by the difference
between his frequency and your BFO.

Most all transceivers provide CW sidetone which is identical to the CW
"offset" they use to determine your CW transmitting frequency. So the
best way to call him on his frequency is to tune the transceiver so that
the note you hear matches the note of your sidetone. (How's your musical
pitch memory?)

Some rigs get fancier than that. I'm currently borrowing a Yaesu FT-980.
It has a button labeled "CW CAL" which generates a tone equal to the CW
sidetone. I can then "zero beat" the incoming signal with the sidetone
and know that I'm exactly on his frequency. It also lets me switch between
a 500, 600, or 700 Hz offset/sidetone/note.

Be aware that listening to a lower pitch note on CW gives you better
discrimination in the event of QRM from nearby stations. It's a real
advantage. 500 Hz is a good frequency to listen to.

(The exception to answering on his frequency is working a DX station in
a pileup. For that it's best to call up frequency a little bit, and he'll
usually listen up frequency a little, so his signal isn't so badly QRM'd
by the pileup.)

>3) Which bands would you recommend for a beginner? Obviously, the novice
>sections of the bands are good. I like 40 meters, but broadcast stations
>usually obliterate the band.

40 meters is really an excellent band, day or night. You might like 80
meters as well, if you can put up an antenna for it. Otherwise 15 is
great during the daytime. Hard to say. :)

I suggest that you try 40 meters at night anyway, because you can work well
between the broadcast stations. Good practice at using your narrow CW
filters as well. If you stay up very late, the European broadcast QRM
dies down quite a bit, and the band is even nicer. In the wee hours of
the morning it's populated with JA's and VK's in the lower 100 kHz.

How to procede with the QSO once you've started ... remember that your
first exchange should include the following information in its order
of priority: His RST, your QTH, your name. Typically you'll end the
text of your transmission like this:

-- --
HW? (or SO HW CPY?) AR AA4KB DE KK6MY K (or KN)

--
Not much need for punctuation ... separate thoughts using the BT prosign.

Say, would you like a sked? I've been working a lot of 40 CW lately, and
love to crank the keyer down and head up to the novice band.

3518. Internet <---> Packet

Newsgroup: rec.ham-radio
Date: 1990-11-29 21:40:24 UTC
From: MARC003@UNLVM.BITNET
Message-ID: <9011292352.AA20828@ucsd.edu>
Source record: 6225

Perhaps the greatest value to hams of such a link as is being discussed would be that hams on a packet network could have access to the vast wealth of information and resources on the internet. I fail to see much value of the average, non-ham, internet user being able to access the packet network's relatively meager resources at this time. Therefore, I would suggest that a solution to this debate would be that initial software on the gateways allow packet network operators (legal by definition:-) access to the internet, however, restrict internet users from accessing the packet network. I know, I know... (but I want to access my home computer from work:-() well, the gatekeeper could set up passwords, secutity locks, etc. and only allow access to the packet network after verification that the accessee is truely a licensed ham.

(a true programmer will spend days creating software to save 15 minutes once!-)

3519. Files available from Kenwood

Newsgroup: rec.ham-radio
Date: 1990-11-29 22:12:45 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <1231@west.West.Sun.COM>
Source record: 6226

I dialed into the Kenwood BBS (213) 761-8284 and was quite pleased
with the depth of the info on line. Here's a sample:

The following is a copy of the file reflst2.doc which is a list
of service bulletins by model number. Each has a file name of
sbxxx.doc where xxx is the bulletin number. Use zeros to fill
the unused positions - i.e. number 35 would be sb035.doc.

I found that some of the files were missing, but I'm sure that
they can be requested.

3520. Sample Kenwood Service Note for TS-440

Newsgroup: rec.ham-radio
Date: 1990-11-29 22:15:25 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <1232@west.West.Sun.COM>
Source record: 6077

Here's a sample service bulletin - # 948

SB-948
TS-440S NOTCH FILTER LOW FREQUENCY IMPROVEMENTS 01/20/89

The low frequency attenuation characteristics of the notch filter can be improved by reducing the input level to the notch filter chip (IC1). To compensate for the loss of input level, the amount of negative feedback to the audio amplifier (IC7) will need to be reduced. This modification is already incorporated in all models beginning with serial number 704XXXX.

REQUIRED PARTS:

120K OHM, 1/6 WATT RESISTOR RD14CB2C124J
390 OHM, 1/6 WATT RESISTOR RD14CB2C391J

1. Disconnect the power supply and antenna.
2. Using a #2 Phillips screw driver, remove the 9 screws from the top cover. Remove the top cover from the transceiver and unplug the speaker wire.

3. Locate resistors R86 and R229 on the component side of the IF board (Figure 1).

4. Using a #1 Phillips screw driver, remove the 7 screws that secure the IF unit to the chassis of the transceiver.

5. Pull the board up and rotate it towards the front of the transceiver to expose the foil side of the board.

6. Desolder and remove both resistors from the board.

7. Install and solder a 102K ohm resistor in place of R86.

8. Install and solder a 390 ohm resistor in place of R229.

9. Assemble the transceiver by reversing steps 1 - 5.

This is an optional change that may not be performed under warranty.

146.94 machine is on Squaw Mtn at 11,700....still formidable but not
like the .97 machine. It runs about 100W though and can be heard a LONG
ways out on the High Plains. It also is situated so that It can be
usable all the way to the Eisenhower Tunnel on IS 70, 40-50 miles West
of Denver. I have even worked it from the ski lift at Loveland ski area
at the Continental divide at the tunnel.

The.. umm... transponders (yeah, thats it) I have read about mostly AM
modulate a microwave carrier with a tone. By the time it comes out
of the detector, the receiver sees the modulation rather than the beat.
That way you don't have to do any adjusting for what his actual
transmitting frequency is (as long as you get the band right).

If you frequency shifted his signal with a mixer and retransmitted just
a few hundred hz away I think you would have feedback problems
(and need REAL hi Q filters to remove the unwanted mixing products).

From: brent@network.ucsd.edu
Message-ID: <4115@network.ucsd.edu>
Source record: 6080

There is a major glitch with the TH-77 with its memories. If you let the battery die down with the radio turned on, you will lose all memories and the radio will reset. Removing the battery pack with the radio on does not affect this, only letting the battery pack die. Terrible engineering flaw...

Brent

You can accomplish the same thing just by switching the transmitter
on and off, which is a little easier than AMing, especially when using
a Gunn source. Not quite the same, but it should still produce the
desired effect.

>If you frequency shifted his signal with a mixer and retransmitted just

Very true. Plus you'd have to track his drift and also worry about
your own car's speed.

3525. Re: Curing Grappler Box RFI

Newsgroup: rec.ham-radio
Date: 1990-11-30 00:40:56 UTC
From: kenw@col.hp.com
Message-ID: <27080028@col.hp.com>
Source record: 6082

I'm not quite sure what a "Grappler" is, but let us assume it is a printer interface box(?). I am further assuming that there are one or more cables connected to this thing.....

There are several things you could try...

1) add a ferrite core over the cable(s). A proper core might be one inch long by 1/2" square with a 1/4" hole down the center. The shape could also be 1/2" round. Some of these are split length-wise so they may be retrofitted around existing cables such as yours. A standard torroid may also work, but you want to loop the cable 1-2 times around the core.

2) add shielding around the main circuit board. I assume that the enclosure is plastic. Try lining it with aluminum foil or other conductive stuff. Make sure the case halves join together electrically all the way around. The I/O connector grounds (shield connections) also need to be attached to this foil at the point where the connectors enter the enclosure.

3) You were correct to try bypassing internally. Is there a crystal oscillator? If so, make sure it has a 0.01 uF from Vcc to ground pins (short leads). Also add 0.01 uF caps across all other ics. There are other internal mods which are really beyond the scope of this discussion. One of which would be to add a ground plane layer (insulated foil would work) under the pc board and then connected to the cable shield connection of the connector. By the way, make sure that neither the enclosure foil nor the ground plane layer touch pc board connections!!! Use plenty of insulating tape.

3526. Re: Re: Allmods for Allmost Everything, Part II VERY long!

Newsgroup: rec.ham-radio
Date: 1990-11-30 00:49:48 UTC
From: kenw@col.hp.com
Message-ID: <27080029@col.hp.com>
Source record: 6083

Go ahead and get the 2SAT...

To open up the receive range:

1) turn off radio

2) press and hold the "B", "#", and "Light" keys

3) use your third hand(!) and turn the radio on. Keep the
keys pressed until the display settles out (2-3 seconds).

You now have 118-136 am, 136-400 (about?) fm. Any frequency
may be stored into the memory channels. Nice radio.

3527. HT experiences?

I am new to amateur radio and am currently in the market for a dual-band 2m - 70cm HT. I have narrowed the search to two units, based primarily on budget constraints. The two in question are the Kenwood TH-77A and the Yaesu FT-470. I would appreciate any comments, or experiences any of you have had with either of these two units.

Thanks,
John Levin JLevin.ElSegundo@Xerox.com

>1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
>but how? What do I send? Like I say, I'm pretty ignorant.

Assume I'm calling CQ:

CQ CQ CQ DE NJ6A NJ6A NJ6A K

you would answer:

NJ6A NJ6A DE KK6MY KK6MY -AR-

where -AR- is didahdidahdit.

I would then answer with something like:

KK6MY DE NJ6A GE OM TNX FER CALL UR RST 599 QTH SAN RAMON, CA NAME HR
JERRY HW CPY? KK6MY DE NJ6A K

In English this is: good evening old man, thanks for the call. Your signal report is 599. My location is San Ramon, Ca. My name is Jerry. How do you copy?

Pick up a copy of the ARRL Operating Manual. It has all you'll need to know. The key point is to just get on the air and give it a try.

>2) On what frequency do I answer the CQ? If I hear him, do I answer him on
>that frequency, or do I move the dial until his tone is at the lowest point?

You adjust your transmitter so it is zero-beat with the received signal. This is very easy to do with a separate tx-rx combination, but it can be done after a fashion with a transceiver. I also have an Icom 735 and I do it as follows: tune your rig until his tone is at approximately zero beat and then tune it up 800 Hz (0.8 on the display). The 735 has an 800 Hz Tx shift on CW. Unless he has a 100 Hz filter, he should be able to hear you without a problem.

>3) Which bands would you recommend for a beginner? Obviously, the novice
>sections of the bands are good. I like 40 meters, but broadcast stations
>usually obliterate the band.

15 meters is good during the day, and sometimes to surprisingly late into the evening. Since you have an advanced ticket, you can use any HF band you want--just call CQ at a low speed. Just about everyone will try to match your speed when they answer you. Or search for someone else calling CQ at a speed you can copy. You'd be surprised at how much slow-speed CW activity there is, even on 20 meters.

>1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
>but how? What do I send? Like I say, I'm pretty ignorant.

If you hear WA6XYZ calling CQ, just send:

WA6XYZ WA6XYZ WA6XYZ DE (your call 3 times) K

>2) On what frequency do I answer the CQ? If I hear him, do I answer him on
>that frequency, or do I move the dial until his tone is at the lowest point?

You want your carrier frequency to match his. On most transceivers, this
means you tune until his signal matches the pitch of the sidetone oscillator
(what you hear when you transmit). This is typically around 700-1000 Hz.

>3) Which bands would you recommend for a beginner? Obviously, the novice
>sections of the bands are good. I like 40 meters, but broadcast stations
>usually obliterate the band.

40 meters is good during daylight hours. 80 meters is good at night.
This is for short distance rag-chewing (couple thousand miles or so).
15 meters is a good "DX" band that is less crowded than 20. 15 is usually
open during the day.

Yeah, What are the standards?

DIN A6 is sort of standard in Europe (That's 148.5 mm x 105 mm (5.85"x4.13"),
but I've also seen 90x140 (mm) which is about 3.54"x5.51"...

When you've solved the problem with non-metrics some standard would
be fine for QSLs :-)

Source record: 6096

I think that you hit on the worst aspect when you wrote that there was nothing in your manual to warn of impending memory loss and what to do afterwards. Unless the exact models at risk and the action to be taken become well known, Icom run the risk of their other models being confused with the 751 etc. Some people have told me already that they had heard that all Icom gear made after some date had this "feature".

It certainly sounds as if the problem is not so bad, if only band edge values need reprogramming. The idea of a ROM/RAM substitution is probably the most confidence inspiring solution. A QST article would help to de-fuse matters, help people, and help Icom avoid the consequences of any overreaction.

With such a small amount of data, perhaps it would be feasible to use a really crude switch-box programmer ?

Sincere thanks !

Source record: 6099

Years ago, at a job far far away, under the name Mikey at trsvax, I posted an article to rec.auto entitled "The Hitch-hikers Guide to Radar Jamming". It brought a torrent from a few net.police types, and a FLOOD of mail requesting more info.

So, I will not repost, but.....

The only practical economical method of jammimg is to overload the front end of the unit by transmitting pulse mode, which is an illegal mode for X-band ham.

Secondly, the new Radar units are much more sophisticated than in 1980. The last unit I looked at had 2 indicators of interest on the display. One was "RF". This went on when the radar unit detected RF energy above a certain strength that MIGHT interfeer with the radar unit, and the unit would shut down the reading and calculations. This is to prevent interference from on-board radios in the cruiser, but I don't at this time know all the details.

The other indicator is "JA", for JAM! This is activated whenever the radar unit detects a jamming signal. I do NOT know if it looks for the pulse or what, but in snooping I SUSPECT the new units put modulate a tone on the carrier and the JA goes on when the unit can't detect it's own tone. But then, I'm not sure. Do YOU want to risk you drivers license AND your HAM ticket?

Mike Yetsko
InterLan

I don't have a radar detector, it's an application specific field strength indicator.

This is an interesting problem. How does a manufacturer build in
frequency limits which may change after every WARC meeting? Although
the Icom design might be improved on (say with a EEPROM or something
like that), it's still a better solution than the one that came with
my Kenwood 940. I assume the processor microcode PROM must be removed
& sent back for reprogramming if the band edges widen. Either that,
or I could incur the wrath of the net and disable band limit
checking altogether by "cutting the wire" :-) It looks to me
like Icom ought to have designed in a way to update the contents of
that RAM while installed in the transceiver...maybe it was planned
but just didn't make it into the final firmware release.

I am the owner of an ICOM 745 which also contains code in RAM. I have
known about this problem for sometime and like many other readers of the
group have been somewhat puzzled as to why ICOM would do such a thing.
After reading this posting, their logic has become clear to me.

By putting the bands and their edges in RAM, ICOM created radios that
can be reprogrammed to reflect new band allocations or changes in the
existing band edges. I remember what a problem the new WARC bands created
in the early '80s. Everyone had to trash their old equipment and buy
new stuff. With the 745/751/751a, all we should have to do, after the
'92 WARC, is send the boards back to ICOM for reprogramming with the new
allocations.

A second reason they might have done this is profit. It was probably
cheaper to design one radio that could be used throughout the world,
and then program in the band allocations for the desired country. This
way, the same board could be used world-wide, and excess inventory in
one country could be diverted to another country just by reprogramming
the board!

I like the idea of a replacement ROM board, but it might be smart for someone designing one to wait until after the '92 WARC so they can include any changes that might be made.

I have a handheld Scanner from DAK, Regency R 4030, that boasts
800 MHz band coverage. Well actually it gets part of the 800 band on the
high and low side, but the middle of the band has been locked out. I was
wandering of anyone new of a quick fix that will "unlock" these frequencies.
Since the PLL is capable of capturing even up into the 900 MHz band I assume
it's not a problem with the capability of the unit but rather Regency purposely
is restiricting these channels.

I had heard about clipping some diodes or something like that. This scanner
looks identical to Bearcat scanners except for some of the plastic colors.
The R 4030 is a 200 channel programmable handheld if that helps any with
identification.

>a catatonic microprocessor.

I just finished balking with ICOM about this battery deal. They say
they recently check an ICOM 751a that has been used less than 10% of
the time. The battery shows no signs of quiting after 8 years. They
expect it to last between 10 and 15 years.

They stated that the following models are affected by the RAM battery
issue:

ICOM IC- 745, 751, 751a, R71, 271, and 47

No other ICOM radios are involved. They said the reason for their use
of RAM was because it was the only RFI immune chip at the time.

(I am just relaying their comments!)

Actually, I have no reason to access my home computer from work. If I did I could just call up the telebit at my house and get fast reliable transfers. (I only have a 1200 bps TNC.) However, I don't have internet access from work. So what you suggest is great! I could ftp sites, etc. from my house.

However, there is one flaw. Me as the end user on the packet side ftps to a site on the internet, through some packet/internet gateway (actually a router). Now I peruse that machines anonymous directory, and do a get on some file I *think* might be interesting. However, to my shocking amazment it contains some foul language (imagine a news digest).

See the point? I still think that this situation falls under the third party traffic rules. I am in contact with a third party who is using the gateway's station for its transmissions. Its just like when you use a phone patch to contact someone via another amateur station. If the person at the end of the patch uses unnacceptable language, then it is up to the operator of that station to do something. (I think repeater autopatches fall under a different set of rules.) On the same line of reasoning the operator of the gateway would still have to screen traffic from the internet side to the packet side.

Now mail would be o.k. One way mail. From the packet to internet. I see no reason why not.

I think that what I would rather see is a reverse of what Tad Cook and some other fine providers of ARRL bulletins do. Instead of forwarding from packet to the net, why not forward news (maybe the digest) to packet. I check out the local packet BBS occassionaly and the technical content of those messages is kinda low. I wish it were higher. Aren't the packet to news forwards manual? I guess they could be automatic. If there is someone out there that is reading the digest, then he could just select the good articles and forward them when he's done. Actually it could even be done through rn or trn.

{>I like to do! All to easy in city traffic though.
{
{Do what I do... I program all NON-ham repeater pairs with the offset in
{the opposite direction (but by the correct amount). In the case of repeater
{outputs in the 450-455 MHz range, you would be transmitting in the ham band.

That is one way to minimize the problem I will admit, doesn't work with the AZ DPS on 460.xx though :-) For practical purposes using simplex will minimize the QRM since they use a PL tone and a repeater. Of course if you get into the repeater ...

I would much prefer a switch or wire to cut however. With a microprocessor controlled rig it would be trivial to add TX enables for every 10 Mhz segment for example, wouldn't even need extra pins on the IC/board since the speed required is low enough to be easily multiplexed.

Now if *I* were designing it ... :-)

Except for any change in coax loss as a result of changing feeder
length, you can not change the SWR of a load (the antenna at the
other end) by changing feeder length. What you can do is to
cause a change in the impedance seen by your transmitter--which
it may like better because you have brought either the resistance
or reactance into the range acceptable by your transmitter coupler.

In article <1990Nov29.033524.23715@informix.com> randall@informix.com (Randall Rhea) writes:
{I have been a ham for 8 months, and have upgraded to advanced class. Would
{you believe that I've never made a CW QSO? I really would like to get
{involved in CW, but I feel like a complete ignoramus. I have an ICOM-735
{with the built-in keyer. I have these questions:
{
{1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
{but how? What do I send? Like I say, I'm pretty ignorant.

THe best advice I can give is LISTEN! See what the other stations are saying. THat advice applies to just about any ham radio activity BTW, ESPECIALLY DXing and contesting!

The normal protocol is to call with a 1 X 3 response. If you were calling CQ for example I would send:

KK6MV DE AA4MW AA4MW AA4MW K

(1) send a little slower than the other station NEVER faster! I sometimes work the novice bands for fun and if someone responds to my 5 wpm call at 35 wpm the I will also send at 35 wpm - and sometimes find its someone "showing off". After a few years of CW the higher speeds are actually much easier than low speeds.

(2) give the station a few seconds (say 20 seconds) to respond and then repeat the call.

Once he responds to you then you can give your rig, QTH etc. just like an SSB QSO.

Feel free to use reasonable abbreviations but don't go overboard. Very few novices can interpret HPE CUAGN SN OM. A table of common "Q" signals is helpful though, you probably know more of these than you think and they were invented for CW.

Don't expect the other guy to be any more experienced than you are - it is a NOVICE band after all. You will both make mistakes, just try to learn from them.

{2) On what frequency do I answer the CQ? If I hear him, do I answer him on
{that frequency, or do I move the dial until his tone is at the lowest point?

Pick a tone that is comfortable, about 1khz. Transcievers are made to offset the TX frequency to allow for this. In heavy QRM use the RIT (if any) to adjust to a lower tone. I have used as low as 100 Hz (with an audio filter and 150 Hz mech. filter in the line too!) in really awfull

conditions, but if things get that bad you should probably QRT.

{3) Which bands would you recommend for a beginner? Obviously, the novice
{sections of the bands are good. I like 40 meters, but broadcast stations
{usually obliterate the band.

I would suggest the 40M novice band in the DAY or 80M at night. Mostly because you WON'T get much DX so the QRM will be lower. THe QRM always gets worse after you start a QSO BTW :-)

Good luck and don't feel self conscious about mistakes, expect them and learn from them!

CW can be a lot of fun and is WELL worth the effort to master it - that means 30+ wpm though not just 13! Get some cassettes with conversations (or W1AW) and listen to them in the background while you do something else. Before a year is out you will be hearing 30+ wpm with no problem.

>"CM". If we had a LMM (we don't), it would id as "MI".

Well, almost. The LOM/LMM IDs do follow that pattern, but it's not the airport ID, but the ILS ID that they correspond to. In the case of the first or only ILS at a field, it's the same as the airport ID (usually), but others bear no relationship to the airport ID at all. Houston Intercontinental is a good example: it has 6 ILSs, and only one can be IAH. The rest are things like JYQ, CJF, ...

(I bet the folks out there weren't aware that us pilot types have to deal with some things that are stranger than even the FCC's worst machinations! :-)

Message-ID: <4387@lib.tmc.edu>
Source record: 6117

There's been some discussion here about my proposal for rec.ham-radio.legal. It's been mostly favorable, and so I'm going to proceed with the formalities getting the group created.

There's been some sentiment for a rec.ham-radio.tech group. The idea, as I understand it, is to move the technical discussions away from the flamage, than the other way around. I have only one problem with this idea: there's more to ham radio than just technical issues. A .tech group would leave the rest of us wading through the legal flamage to find articles of interest that aren't technical, but aren't controversial either.

I feel that .legal is the most logical split to move the flamage, and leave non-controversial articles, available in the group. Hence, I'm sticking with the original proposal.

Expect to see the formal Call for Discussion in news.announce.newgroups next Monday morning.

For the last couple of years, the local ARES organizations have set up a booth at one of the local Malls (Newpark Mall in Newark, CA) to send holiday traffic for shoppers.

This year we expect to be asked if there is anyway to send message to service-people stationed in Saudi Arabia.

Therefore:

Is there any NTS link to MARS (or any other way) to send traffic from an NTS packet station to service people overseas?

By the way, the most difficult problem is finding shoppers that know the telephone numbers and zipcodes in order to send proper NTS messages. Hopefully, significant prior publicity will help this year.

Holiday cheer to all,

Jerry, can you please explain to us how you know that the person calling is male? I find it impossible to distinguish male cw sending from female cw sending, so I would really appreciate knowing the secret. I wouldn't want to address a male ham as a female, or do the reverse. I'm sure you don't want to perpetuate the idea that only males can be radio hams, or do you?

I just received this note on packet. It might be of interest to those who own
Uniden 10-meter transceivers and wish to use them on packet and/or AMTOR:

Msg# TSP Size To @ BBS From Date Time Bid
15362 PY 1569 KD2BD N7ETV 901130 1711
Subject: UNIDEN QSK MODIFICATION

Thanks!!! to Craig, N7ETV for the following info...I will copy this to all
of you who responded to my message.
Mike/KA3NVP

HELLO:
AFTER HOOKING UP MY HR-2600 TO MY PK-232, I FOUND I HAD SOME PROBLEMS
USING IT IN AMTOR. SINCE I LOVE TO MODIFY AND "FIX" RIGS, I GRABBED MY
TEST EQUIPMENT AND SET OUT TO FIND OUT WHY THERE WAS A LONG SWITCH-OVER
DELAY TIME. AFTER A FEW MINUTES, I FOUND OUT THAT THE RECIEVER WAS COMM-
ING UP OK. IT WAS THE MUTE CIRCUT THAT WAS SLOW. I FOUND TWO CAPACITORS
THAT WERE RESPONSIBLE FOR THE DELAY IN THE MUTE CIRCUT. TO FIX THE PROB-
LEM, CHANGE OUT C74 AND C99 (BOTH ARE 4.7uf @ 50VDC) WITH .01uf DISC CAP-
ACITORS WITH A VOLTAGE RATING GREATER THAN 15VDC. THESE CAPACITORS ARE
ALSO FOUND IN THE HR-2510 AS WELL. THESE SEEM TO BE C139 AND C99 IN THE
HR-2510 IF MY COPY IS RIGHT. THESE CAPACITORS ARE LOCATED NEXT TO THE
AUDIO OUTPUT IC (TDA1905) IN THE RADIO. THIS I.C. IS LISTED AS IC2 IN THE
HR-2600 AND IC103 IN THE HR-2510. I ALSO FOUND THE S/RF METER TO BE VERY
SLOW IN MY RIG. I FIXED THIS BY CHANGING C302 ON THE CONTROL UNIT (LOCATED
NEXT TO J304) TO A .01uf DISC CAPACITOR ALSO. THIS CAPACITOR IS ALSO IN
THE HR-2510. AFTER THESE MODIFICATIONS, I HAD NO MORE PROBLEMS MAKING ANY
CONNECTS IN ANY MODE. 73'S AND ENJOY THE UNIDEN!

>88, old woman -

Coming from someone whose login is the trademark of the ultimate in
macho womanizing males, I find your false piety ludicrous.

Linguistic pseudo-feminism is the hobgoblin of tiny minds. It's an easy
victory in an unchallenging battle, and of no possible interest to
anyone who has risen above the pharisaic.

Indeed, "OM" could have easily stood for "Old Mother", or perhaps even
"Old Mother-....". So Jerry could be incorrect. But given the current
distribution, he's more likely correct in imputing a male rather than a
female on the other end of the connection. Now if you want to do
something about THAT, you have a worthwhile target for your apparently
overabundant energies. And you would stop annoying the rest of us while
you're at it.

That is, if you think most hams are human. I often wonder.

>of these two units.

I've commented on this before, but here goes again. I am very impressed with the FT470. I was a confirmed Icom'aholic before I got the 470. I think it is the best feature for the dollar radio on the market. It's extremely rugged with a metal case. I've now dropped mine off a tower and it survived. There are a couple of complaints keeping it from being perfect however. First, the receive audio is not very loud making it a little hard to use in an open jeep at speed. Secondly, the desk charger is a strict timed charger with no sensing. It can fry your batteries. Other than those two complaints, however, I love this radio. It's keyboard command system is among the easiest to understand and use of any of the HTs. If you use one for a week, you'll never want to go back to anything else (IMHO).

> without the supervision of a control operator.

Well, 'stating the message' - TO ME - means real time transmission. Any other interpretation of the word seems to me to be unnatural 'lawyer-ese'. Actually, the regulations seem to me to be based on an archaic understanding of HOW third party traffic is transmitted. The regs just didn't envision the "Look, Ma, no hands" capabilities we have now. They are a throwback to the day when the only way anything got on the air was for a live human bean to DO something NOW.

> Of course the control
> operator can use mechanical aids--I never said he couldn't--but the use
> of such aids doesn't absolve him of the responsibility to continously
> monitor and supervise the third party's participation.

I guess we differ on the meaning of 'continuously monitor and supervise' also. To me, initiating an ongoing mechanical process and periodically checking its report mechanism IS _continuous_ . Sort of like baking a cake. You put it in the oven and check it from time to time. You don't need to sit in front of the oven and stare at the cake through the little window.

If we take your definition literally, the control operator would not even be allowed to blink.

> The FCC's major concern is not that someone might say a naughty word

3569. The Hate Herbie Net

Newsgroup: rec.ham-radio
Date: 1990-12-01 06:42:03 UTC
From: flash@lopez.UUCP
Message-ID: <1990Dec1.064203.3875@lopez.UUCP>
Source record: 6129

The 20 meter mess has taken a new turn. Herb KV4FZ and his BARF group have something else to take on, namely a new group. One with no official name. These guys started the 14.313 Peace Coalition net a couple months ago. They moved up from 3894.5. Originally they tried to talk to the Barf Group, but incompatabilities arose, and since both groups have "strong personalities", what has resulted is two groups that refuse to talk to one another, and if a member of one group happens to transmit while the other group has control of the frequency, they scream MALICIOUS INTERFERENCE, and they call the FCC. This is, of course going to do our hobby no good at all.

Since I work out of my home, runing this public access unix site, I am able to monitor 14.313/14.300 all day until band closing. I have heard some amazing stuff the past couple weeks.

The new group can only be called the HATE HERBIE NET. They get on and play tapes of Herb and the boys. Tapes recorded from 2 meter repeaters on St. Croix, and other recordings trying to show that the Barf people lie, and are hippocrites.

Barf, not to be outdone, comes on after the HATE HERBIE NET, and debunk all the stuff, and play tapes of their own, and the 20 meter war goes on.

I think EVERYONE out there with an HF rig should at least listen, so you know what is going on on these two frequencies. If you hear an orgainzed net without a lot of shouting and QRM, tune to the OTHER frequency. Sometimes go up or down a few KC, and you will hear the two groups badmouthing one another.

The problem I have with the new group (WB2PZT and COMPANY) is that they use very foul language, and are prone to talking in a manner that they call "Adult Entertainment". Those familiar with the stuff that is heard on 3868 and 3894.5 know about this off color stuff, and foul language. PZT (I think it was him, might have been one of the others) Got drunk on the air one day, and began using the F-word in just about every sentence. These boys have actually said right on the air that the FCC does not care what kind of language they use. I find that hard to believe.

If you are trying to introduce someone to ham radio, you would do well to avoid 20 meters. One day last week, a teacher came on who was there with his class (It was ADULT EDUCATION, FORTUNATELY) and was saying how this stuff does not sell ham radio very well.

I could not agree more. While I have to admit that I sometimes rather enjoy the confrontations, ESPECIALLY now that they are talking about something OTHER than Phone patches.

Thanksgiving night, HERB, KV4FZ, who is the anti phone patch KING of BARF Was in contact with a ship in the Persian Gulf, and ran many patches at his own expense for the guys on the ship. The HATE HERBIE group claims that when he did this, he "Commandeered" the frequency that they were in QSO on. I did not hear the beginning, but later HERB played back the tape he made on HIS END, showing PZT and the others YELLING while Herb was running the Patches. The yelling included the foul language that the group is famous for.

Now whether or not it is true that Herb took the frequency, these guys should know that by interfering and screaming while a patch is in progress, they only degrade the hobby. If that had happened to me, I would have at least kept my mouth shut til AFTER. And of course if I WAS on and someone wanted to run such patches, I would not mind giving up the frequency, and sitting back and becoming an SWL for a bit.

Listening to both sides in this dispute, one finds distaste for behaviour of both groups, and also some agreement with things the two sides present.

And the WAR goes on.

Herbie. Pay your fine.

In article <647@wells.UUCP> k3tx@wells.UUCP (Dave Heller) writes:
>Such garbage. If radar helps keep the highways slower=safer, i'm all for
>it. Make radar detectors illegal everywhere!

Shall we parse the above statements?

IF radar helps keep the highways slower / =safer, /[THEN] i'm all for it.

Perfectly good statement, however there is the implied postulate (or
Theorem yet to be proved) "slower=safer". In any event, I'm all for letting
him be all for it.

Make radar detectors illegal everywhere!

Pray tell, how does this follow from the first proposition? There is
(at least anecdotal) evidence that the use of radar detectors causes would-be
speeders to be more conscious of their speed and (when the radar is near),
actually slow down. This would appear to be a desirable effect. Yet,
Mr. Heller would have us outlaw their use. The net effect of THAT would seem
to me to be MORE speeding, with (possibly) higher revenues for the police; at
least as compared to the legal radar detector scenario.

So which is it to be... road safety or more revenue?

Marc Kaufman (kaufman@Neon.stanford.edu)

>standard here in Colorado.
>
>John Schmidt, NK0R

Amen to that! We just brought up a new machine with a S-Com 5K controller. This has got to be the best commercial controller available for the money. The construction is very high quality (we bought the rack mount option), and the system is fully programable via touchtones. Programming codes can be restricted to the control link, if you desire, on a code by code basis. So you can allow the general user community access to some functions while protecting others. Different levels of access are controlled by passwords, so you can have more than one class of user. There are command macros that you can build to allow complex functions be performed with a single command. There are auxillary inputs and outputs that you can use for external status and control functions. There is a real time clock allowing mode changes depending on the time of day. Link receivers and transmitters are easily accomodated. Full schematics and parts layouts are provided along with an exhaustive programming manual. And the price is right. Don't overlook S-Com if you are shopping for a new controller.

QST DE W1AW
DX BULLETIN 47 ARLD047
FROM ARRL HEADQUARTERS NEWINGTON CT
NOVEMBER 30, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

THANKS TO ALLEN SINGER, N2KW AND THE TRISTATE DX PACKETCLUSTER NETWORK, STEVE, W9NUF, AND THE NORTHERN ILLINOIS DX ASSOCIATION, DOC, W9NSZ AND CARINE, ON7LX, FOR THE FOLLOWING DX INFORMATION.

ALBANIA, ZA. CHANCES OF WORKING ALBANIA BEFORE THE END OF THE YEAR ARE IMPROVING. IN ADDITION TO THE ANTICIPATED HUNGARIAN EXPEDITION, SEVERAL EUROPEAN GROUPS NOW CLAIM OPERATIONS WILL COMMENCE IN MID-DECEMBER. KEEPING TUNING.

ANTARCTICA. SEVERAL NATIONS ARE ACTIVATING THEIR BASES DURING THE ANTARCTIC SUMMER THIS YEAR. ZL0AAF AT SWAN BASE IS LOCATED ON BALLENY ISLAND, MUCH TO THE DELIGHT OF ISLAND HUNTERS. G1SWW WILL BE SPENDING 2 YEARS AT HALLEY BASE, STARTING FEBRUARY, 1991. HE WILL SIGN VP8SWW AND VP8HAL ON SSB. VP8GAV AND VP8FAR ARE AT FARADAY BASE. IA0PS WILL ACTIVATE TERRANOVA BAY AROUND FEBRUARY 15, WITH OPERATORS IK0AIH AND I0MAX KEEPING QSL MANAGER IK0GPP BUSY.

CROZET, FT8W. FT4WC HAS BEEN REPORTED ON 14027 KHZ AT 1300 UTC. QSL VIA F6GVH.

CHATHAM ISLAND, ZL7. HA9RE AND HA8XX WILL SIGN ZL0AAD/7 AND ZL0ADN/7 STARTING DECEMBER 11 FOR 2 WEEKS. QSL VIA DJ1ND.

IRAQ, YI. YI1BGD HAS BEEN VERY ACTIVE ON 10 METER SSB FROM 1300 UTC. ON7LX, DF3NZ, AND OE6EEG HAVE BEEN HELPFUL IN GETTING A YI QSL SINCE THE EMBARGO OF IRAQ INCLUDES MAIL.

KAMPUCHEA, XU. JG1RVN, WILL SIGN XU1DK FROM DECEMBER 3 TO 7. EMPHASIS WILL BE RTTY, CW, LF. IT IS NOT CLEAR IS THIS THE SAME OPERATION ANTICIPATED BY 9V1YC, DECEMBER 13 TO 20, OR AN

INDEPENDENT EFFORT.

KURE ISLAND, KH7. KD7P/NH7 OPERATION IS ANTICIPATED FROM DECEMBER 12 TO 21. EMPHASIS WILL BE ON CW AND RTTY.

LESOTHO, 7P. ZS5WT AND ZS5BK WILL BE ACTIVE AS 7P8CW OR APPENDING /7P8 TO THEIR ZS CALL SIGNS FROM DECEMBER 13 TO 18. EXPECT PLENTY OF CW ON 40 AND 80 METERS.

MALAWI, 7Q. VINCE, 7Q7VP, LIKES 21240 KHZ AT 1930 UTC. QSL TO BOX 2111, BLANTYRE, MALAWI.

MALDIVE ISLAND, 8Q7. MIKE, K9AJ, ALONG WITH SUE, KA9RHK, WILL SIGN 8Q7BQ ON ALL BANDS, UNTIL DECEMBER 9. HE HOPES TO BE ACTIVE AS HS0AC DECEMBER 11 TO 14. QSL TO K9AJ.

MOROCCO, CN. N6AMG IS QRV UNTIL DECEMBER 7. HE IS WORKING THE WARC BANDS AND 6 METERS.

MOUNT ATHOS, SV/A. APOLLO, SV2ASP/A, IS A MONK WLL BE OPERATING FROM MOUNT ATHOS FOR SOME TIME. HE LIKES 21335 KHZ AND HAS BEEN ACTIVE IN LIST OPERATIONS ON THAT FREQUENCY FOR THE PAST WEEK.

PENGUIN ISLANDS, ZS1. OH2BH, OH2RF, N7NG, AND ZS6BCR ARE ACTIVE AS ZS9Z/ZS1 THIS WEEKEND. CW, 24 KHZ UP FROM THGE. SSB, 45 KHZ UP FROM THEIR BAND EDGE. QSL VIA OH2BH.

REVILLA GIGEDO, XF4. XF4F LIKES 14030 KHZ AT 0200 UTC WHERE YOU CAN ARRANGE SKEDS FOR 10, 15 AND 20 METERS. QSL TO WA3HUP.

SAN FELIX, CE0X. THE XQ0X OPERATION HAS BEEN DELAYED. QSL MANAGER, CE3ESS, ESTIMATES ARRIVAL ON DECEMBER 6. THIS WILL BE AN ALL SSB OPERAON UTILIZING LISTS DUE TO THE LANGUAGE LIMITATIONS.

SOUTH SHETLAND ISLAND, VP8. THERE IS A GREAT DEAL OF ACTIVITY HERE IN ANTICIPATION OF THE ANTARCTIC SUMMER. SP5FYM WILL JOIN THE CREW AT HF0POL WHERE HE WILL QSL HIS RTTY OPERATIONS VIA SP3HLM. CE9GEW IS ANOTHER SOUTH SHETLAND OPERATION, OFTEN FOUND ON 14143 KHZ AT 2200 UTC WITH THE SOUTH AMERICAN DX NET.

SIX METERS. THE 50 MHZ BAND IS ALIVE THIS SEASON WITH ACTIVITY BY D68GA1Z, ZS9Z, 6W1BC, CN2JP, KD7P/NH7, KA3B/C6A, KP2A, 9L1US, Z23JO, AND NUMEROUS EUROPEAN STATIONS. AT TIMES, IT SOUNDS LIKE 10 METERS.

WALVIS BAY, ZS9. LLOYD AND IRIS COLVIN CURRENTLY ACTIVE AS W6KG/ZS9 . ON DECEMBER 3, THE PENGUIN ISTEAM WILL SIGN ZS9Z FOR 3 OR 4 DAYS. ZS9A CONTINUES HIS 10 METER ACTIVITY ON THE WEEKENDS.

NOTE 1. A LETTER TO W1AW, FROM DOC, W9NSN STATED HE HAS COMPLETED THOUSANDS OF CONTACTS QSL VIA HIS CALLBOOK ADDRESS AS IT HAS BEEN CORRECT FOR MANY YEARS.

NOTE 2. ALSO, A LETTER FROM CARINE, ON7LX, STATES LOGS FOR 9K2KS ARE IN HAND UP TO APRIL 21, 1990. NO LOGS FOR THE 9K25KS OPERATION. ALSO HAS THE LOGS FROM SAMY, YI1BGD, UP TO THE END OF FEBRUARY, 1990. ON7LX HAS A NEW POST OFFI THE NEW NUMBER IS 8210 INSTEAD OF 8021 LOPPEM.

NOTE 3. KC4MJ IS NOT THE QSL MANAGER FOR PA3CXC/ST0.

NOTE 4. 6FXBCS IS VE7DP OPERATING FROM MAGDALENA ISLAND, MEXICO.

NOT5. 5N0MRD OPERATES FROM THE GERMAN EMBASSY IN LAGOS. SINCE HIS QSL REQUESTS ARE REGARDED AS OFFICIAL MAIL, HE HAS BEEN RETURNING IRCS AND GREENSTAMPS RECEIVED WITH HIS MAIL.

GOOD LUCK ON DX DE KB8NW/OBS

SPECIAL BULLETIN 14 ARLX014
FROM ARRL HEADQUARTERS
NEWINGTON CT DECEMBER 1, 1990
TO ALL RADIO AMATEURS

ACCORDING TO THE LATEST INFORMATION FROM THE JOHNSON SPACE CENTER,
THE LAUNCH DATE AND TIME FOR THE STS-35 ASTRO-1 MISSION WILL BE
SUNDAY MORNING, DECEMBER 2, 1990 AT 0638 UTC OR 0138 EST.

TO MINIMIZE INTERFERENCE WHEN TRYING TO WORK THE SHUTTLE, PLEASE
DON'T TRANSMIT, PARTICULARLY ON 144.95 MHZ, UNTIL THE SHUTTLE IS IN
RANGE OF YOUR LOCATION.

LISTEN TO THE GODDARD AMATEUR RADIO CLUB STATION, WA3NAN, FOR LIVE
LAUNCH COVERAGE ON 3860, 7185 AND 14295 KHZ.
```

3578. Re: transvert a CB radio to 6M am subband?

Newsgroup: rec.ham-radio
Date: 1990-12-01 16:23:04 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <377@ka2qhd.UUCP>
Source record: 6138

After I converted my Cybernet board (Hy-Gain) to 10-meter FM, I converted it to scan all 10 cordless phone frequencies (46 MHz), with the PLL codes for each phone channel stored in an EPROM.

I have no doubt that a similar conversion could be performed to enable operation on 6 meter FM.

73, de John, KD2BD

3579. Alinco 2M/440 Xcvr with DTMF control

Newsgroup: rec.ham-radio
Date: 1990-12-01 17:16:54 UTC
From: bobw@col.hp.com
Message-ID: <27080030@col.hp.com>
Source record: 6139

There is a full-page ALINCO ad in Dec QST which claims that
their 2M/440 dual band transceiver (DR-590T) has DTMF remote control
capability as well as crossband repeater function. This sounded
interesting to me --- put a transceiver on a mountaintop,
use an HT on 440, crossband repeat onto 2meters.

I called Alinco and got the following disappointing story.
Almost everything can be controlled remotely including power
level, crossband repeat on/off, frequency and memory recall.
The bad news is that the transmit offset cannot be selected.
(I never did get an answer to whether the rig automatically
choses offset on 2M. The guy said that "most repeaters in
the US have - offset.")

The Alinco guy's suggestion was to use the Memories instead.
(i.e. have all your favorite repeater freq's stored in memory
which does remember offset.) Only problem there is that the
memories can be selected only using "next memory up" and "next
memory down" control functions. There apparently is no "go to
a particular memory" function. This is OK until you forget
where you are.

I found it hard to believe that they had such robust functionality
but left out some critical features.

Can anyone confirm or deny what I've stated? Anyone have this
radio?

Bob Witte HP Colorado Springs Division

3580. Re: TH-77 problem. Beware...

Newsgroup: rec.ham-radio
Date: 1990-12-01 20:16:08 UTC
From: jpd@pc.usl.edu
Message-ID: <19808@rouge.usl.edu>
Source record: 6146

In article <4115@network.ucsd.edu> brent@network.ucsd.edu (Brent Jones) writes:
>There is a major glitch with the TH-77 with its memories. If you let
>the battery die down with the radio turned on, you will lose all
>memories and the radio will reset. Removing the battery pack with the
>radio on does not affect this, only letting the battery pack die. Terrible
>engineering flaw...

I've had this happen twice to me, too. I have APO and batt. saver on (the
defaults). But it doesn't always happen after the battery dies. I will
try remember to just remove the pack if I suspect the battery died, rather
than play with the power on switch. I have a suspicion that leaving the
power switch alone may be the way to have the memories survive a dead battery.
Can anyone confirm or prove this theory erroneous?

It is published every week and is made available for unlimited distribution.

* MINI-TUTORIAL *
================
Keplerian data is widely used in the analysis of satellite orbits and the
development of satellite tracking data for groundstations. These elements
define the position and motion of a satellite in orbit around a larger body.

The first person to investigate elliptical orbits thoroughly was the
mathematician and astronomer Kepler. He formulated a set of rules for
elliptical orbits and was able to demonstrate that all planets followed
such orbits in their motions around the sun. Over 100 years later, orbital
elements defined by Kepler are still being used by astronomers and satellite
trackers worldwide.

Radio amateurs use a sub-set of Keplerian data that usually includes:
Reference Epoch Time, Inclination of orbit, Right Ascension At Ascending
Node, Eccentricity, Argument of Perigee, Mean Anomaly, Mean Motion
(sometimes replaced by Semi-Major Axis), Decay Rate, and orbit number.

REFERENCE EPOCH: (YYDDD.XXXXXXXX)

This is the precise time that the other time dependent elements are referred
to. The format consists of a two-digit year number followed by a three digit
day number, indicating the number of days since 01-Jan (day 0), and then the
fraction of the day, which represents the hours, minutes and seconds, where
one day equals 24 hours (one solar day).

Example: 03-Dec-90 12:30:15 UTC

03-Dec-90 = Year 90, day 337

12 Hours = 24/12 = 0.500000000
30 Minutes = 30/1440 = 0.020833333 add to 0.521006944
15 Seconds = 15/86400 = 0.000173611

Therefore, 03-Dec-90 12:30:15 UTC = 90337.521006944

INCLINATION: (XXX.XXXX degrees)

This is the angle between the satellite orbital plane and the Earth's equatorial plane. A satellite with an inclination of zero degrees orbits exactly over the equator, while one with an inclination of 90 degrees orbits exactly over the poles.

RIGHT ASCENSION AT ASCENDING NODE: (XXX.XXXX degrees)

The right ascension at which the satellite crosses the Earth's equatoral plane going from south to north. Right ascension has traditionally been defined as the "first point" in the constellation Aries.

ECCENTRICITY: (0..1)

A dimensionless term used to describe the "flatness" of the elliptical orbit. A circle has an eccentricity of zero. A line has an eccentricity of 1. The orbit of OSCAR-13 has an eccentricity of about 0.7.

ARGUMENT OF PERIGEE: (XXX.XXXX degrees)

The angle between the line from the Earth's center to the satellite's point of lowest altitude (perigee) and the line from the Earth's center to the point where the orbit crosses the equatorial plane, going north.

MEAN ANOMALY: (XXX.XXXX degrees)

The angle which specifies the position of a satellite in its orbit, measured from perigee.

MEAN MOTION: (XX.XXXXXXXX perigees per day)

This is the number of perigee crossings the satellite makes in exactly one solar day (24 hours).

The semi-major axis of ellipse can also be calculated from mean motion using:

SMA (km) = 331.25 * (1440/MM)^(2/3)

Some satellite tracking programs use SMA as a replacement for mean motion. The quantity (1440/MM) yields the anomalistic period of the satellite (in minutes between perigees).

DECAY RATE: (+/- 0.XXXXXXXX perigees per day per day)

This is the first time derivative of mean motion and specifies the rate at which the mean motion is changing. A positive decay rate indicates the satellite is falling (speeding up). Decay rate gives an indication of the extent of atmospheric drag on the satellite.

ORBIT NUMBER: (XXXXX)

The number of perigees the satellite has experienced at the reference epoch.

3584. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-12-01 22:23:02 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9012012223.AA19206@blackbird.afit.af.mil>
Source record: 6141

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

3585. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-12-01 22:23:51 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9012012223.AA19237@blackbird.afit.af.mil>
Source record: 6142

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

Derek, can you please explain to us how you know that the person
calling is english-speaking? I find it impossible to distinguish
english cw sending from non-english cw sending, so I would really
appreciate knowing the secret. I wouldn't want to address an
english-speaking ham as a non-english speaker, or do the reverse. I'm
sure you don't want to perpetuate the idea that only english speakers
can be radio hams, or do you?

3587. Usenet Un-Net strikes again

Newsgroup: rec.ham-radio
Date: 1990-12-01 23:40:37 UTC
From: obrien@aerospace.aero.org
Message-ID: <93141@aerospace.AERO.ORG>
Source record: 6149

Had a good time with the Usenet Un-Net this morning, though I must say that it seems to be primarily an East Coast phenomenon. I could barely hear the stations and they could not hear me, except for one intermediate station who was kind enough to relay my check-in (and got my call wrong - it's KC6OJW, not KB6).

One confused person from Tabago checked in by accident. 10 meters was definitely open this morning.

Check in and check it out. 28.390 or 28.410, depending on QRM, Saturdays 1700-1900Z. Be there...or be somewhere else.

Yes, the ARRL Handbook shows the Morse characters for Japanese, Korean,
Arabic, Hebrew, Russian (Cyrillic), and Greek. Also some special characters
added to the usual international set for certain European languages
and for Esperanto.

If you don't have access to the Handbook, perhaps someone can suggest
another source.

>I'll take that seriously after they get rid of the non-ham taxicabs,
>truckers, boaters, and balloonists...

Yeah, I tend to agree. I suppose they are just as concerned about detecting and tracking the potential criminal use of the telephone. Face it, for almost any real application (criminal or legal) the phone (conventional or cellular) is a heckuva lot more practical than amateur radio will ever be.

I still wonder if the third-party rules aren't really intended to ensure the continuing uselessness of amateur radio to society at large, all the better to cause it to die more quickly so its frequencies can be given to other services.

I'm not saying that amateur radio should go commercial. Its prime functions of volunteer communications and technical development should remain unchanged. But strict rules based on the premise that even the isolated semi-business use of amateur radio is so horrible that each and every non-amateur message has to be manually censored before it can enter amateur frequencies have destroyed most of the opportunities for synergistic cooperation between amateur and non-amateur networks. And that's a shame.

In article <276@bongo.UUCP> julian@bongo.info.com (Julian Macassey) writes:
>
> But one thing that does work is to connect a TNC back to back with a
>dial up modem on auto answer. It is then possible to call the home TNC
>from work and do some packet radio on company time.
>
I would feel nervous doing this unless I had something between the
packet rig and the phone modem to make sure it was _me_ calling up.
Something like, say, a _computer_. Hey, wait a second! I already
have a computer hooked to both the phone modem and the packet setup.
Now all I would need to do, is to write a program that answers the
phone when it rings, accepts a password, and then connects the two com
ports together, echoing characters from the one to the other, until it
saw some really off-the-wall escape sequence. Then my program would
hang up the phone. Or has someone already invented this wheel?

- Jerry Kaidor, KF6VB

I've had a Radio Shack Coco II running OS9 (a mini-Un*x) with a modem on one
port and the TNC on another. I'd dial to the computer at home from work and
connect to the TNC with a terminal emulator program to play packet. It was
great fun to run a QSO with a friend in Montana from Fort Collins via
the 145.01 NetRom nodes while at work. The packet speed was just right for
still getting real work done - a sentence came through every 5 or 10 minutes.
If my boss ever came by - I'd just iconize the window the session was
running in.

OS9 has a simple password scheme so there was enough protection to keep out
anyone but a dedicated hacker.

I know of other folks locally that have done the TNC to Modem connection.
Not quite as secure but definately workable.

3591. Re: RC-850 Controller Info Needed

Newsgroup: rec.ham-radio
Date: 1990-12-02 00:56:29 UTC
From: alan@km4ba.UUCP
Message-ID: <208@km4ba.UUCP>
Source record: 6150

FYI,

Before you buy that product, you might be interested
in a conversation that a good friend of mine had with
the Pres. of that company abt 1 mth ago. You know who "the company"
is.

My friend was concerned over the lack of interest that "the company"
had in correcting bugs and improving operation of their
products. The rpt group in question has several of "the company"'s
products. (85, 850, DVR, full remote base, FC-1, packet I/F)

They have had several occurences of "the company" bug fixes introducing
new bugs & problems with the other "the company" products. There are
also known problems that will cause the products to "lock up"
when certain operations are tried. (Legimate commands)

When asked abt the problems & bugs, the pres responded with
market-speak that the DVR & remote base users were such a
small percentage of their business that they were not going
to invest the time to correct them. When pressed on the issue,
he responded that the entire ham market was a small percentage
of what they do, and was difficult to deal with. When asked
again abt the bugs, he basically stated that the answer was no.

When asked abt why they were still advertising & selling
products knowing they were not going to support/enhance them,
the pres seemed to lose his temper. (Brings to mind some
"the company" ads..)

My friend walked away with several observations:

1) "the company" is losing/has lost interest in the ham mkt.
(Despite their ads & hamfest efforts)

2) That despite what they say, their accessory products
are supported at a reduced level. (Less users=Less support)

3) Operating a complete "the company" system becomes very difficult.

4) The quality of "the company" firmware upgrade does not seem to be
fully tested.

5) Of the controllers available, "the company" is the least interested
in "enhancement-requests". They are "use it they way it
is, or go somewhere else" in this respect.

6) Future purchases of "the company" products are doubtful.

They mainly bought the "the company" system because because they were the
only ones offering a "complete" system. Since the "system" is
full of holes, they are not "happy campers".

There are other products that are engineered better, but do
not have as many bells & whistles. They have been buying them
for new projects.

So, knowing that I was not there, and this is second hand, give
me a call if you want to speak with the person who *was* there.

I guess to prevent the "the company" lawyers from putting me in the
poorhouse, I will state:

That the events described above are anecdotal (sp?)
and are strictly hearsay.

However, call me if you want to talk 1st person to the guy who
was there.

caveat emptor!

I don't know about the postal regulations, but the bigger cards are
(to put it politely), a pain. If you're using the plastic wall hangers,
they just don't fit.

It's not a big deal - just kinda frustrating when a person likes to display
all the cards in order received.

Source record: 6145

John,

I, too have been shopping for HT's, and like the TH-77A and FT-470. I haven't gotten to play with a TH-77A yet, but I've been borrowing an FT-470 for 3 weeks now, and here's my comments:

Good: * Easy to use keyboard, easy to read display, all the standard features, including PL encode, out-of-band receive, etc.
(ICOM charges $45 more for PL encode :-(.
* Perfect size case and perfect size buttons. The ICOM's are either too big or too small.
* Lit buttons
* Nice sounding speaker and microphone (I've listened to others transmitting with the 470.)
* Good scanning modes
* Knobs on top of the unit are easy to access and turn.

Bad: * Image rejection/intermod - Pagers frequently screw up the ham bands.
* Poor sensitivity out-of-band (I've actually measured this as well as experienced it. The weather station at 162.55 comes in much weaker than on an ICOM-2GAT).
* Doesn't have 15KHz step. This turned out to not be as big a deal as I thought it would be, but it would be nice if it had it. It does have 5Kz, 12.5Kz, etc. steps, just not 15KHz.
* Out-of-band range is MUCH smaller than that of the ICOM-24AT or TH-77A (with mods).

Other comments: Whatever you do, get a better antenna than a rubber duck. I use a Diamond RH-77, which works very well.

edg@netcom.UUCP (Edward Greenberg) says:

In article <47000@apple.Apple.COM> winter@Apple.COM (Patty Winter) writes:
>.. Does it make a
>female ham feel welcome when someone says, "TNX FER CALL OM"? Hell,
>no. It's a simple enough habit to change, so why denigrate sincere
>requests to do so?

Is there a similar handle by which to address a YL. I've never heard YL
used in the first person, and it seems rather offensive anyway.

Anyway, what do you guys :-) think is a good thing to put in the
blank in:

GE ___ ES TNX FER THE CALL.

I don't really think you need anything. I think it's perfectly OK to send
"GE es tnx fer call, ur RST .... (etc.)" on the first over, the other person
can then address you by name on the next over, and you can do the same the
next time around too. When you think about it, it's pretty artificial to
address someone by their first name within seconds of meeting them, when
they are perhaps halfway round the world and you may never run into them
again. I do it, I think it's friendly, but it's still somewhat artificial.

I have occasionally had someone (non-U.S.) ask whether I am a "YL or OM",
I usually don't even think about the gender of the invisible person at the
other end of the QSO. I did hear an amusing exchange between a U.S. op and
a Chinese ham recently, in which the BY said "name is Gu/YL", meaning her
name is Gu and she's a female. This seemed to confuse the US ham, who had
to ask for a repeat, and for the rest of the QSO sent things like "tnx for
the QSO, Gu/YL...", I suppose Chinese names are confusing anyway....

As a side benefit, it also assists safety conscious drivers to pinpoint
those portions of the Interstate that are considered by knowledgeable
authorities to be fraught with hazard as a consequence of the large number of
motorists driving without due regard for safety. :)

3598. SAREX Operating Schedule in UTC

Newsgroup: rec.ham-radio
Date: 1990-12-02 09:42:15 UTC
From: techpubs@PRC.Unisys.COM
Message-ID: <15813@burdvax.PRC.Unisys.COM>
Source record: 6158

Below is the SAREX operating schedule with dates and times given in UTC and adjusted for actual STS-35 launch time. The basic data for this schedule comes from "STS-35 SAREX Shuttle Amateur Radio Experiment Information Summary" as distributed on rec.ham-radio by N5WQC/W5RRR on 29 November.

The first three columns give Mission Elapsed Time (MET) in Days, Hours, and Minutes. The next three columns give the same time in Universal Coordinated Time (UTC) in Day of the Month, Hours, and Minutes. The final column identifies the nature of the event to occur at that time.

Be careful when using these UTC times that you are really thinking in UTC and not in your local time. Remember for example that Tuesday December 4 01:30 UTC is Monday night December 3 20:30 EST, 19:30 CST, 18:30 MST, or 17:30 PST.

Good luck and happy Shuttle DX'ing.

Official launch time is 2 December, 1990, 01:49:01.07 UTC

This is yet another ham tradition, and a harmless one. It emphasizes that all hams, whatever else they may be, belong to the (what's the non-gender-specific equivalent to "fraternity"? I think "frarority" is an abomination.) of hams. While I may not consider addressing JY1 as anything but "your highness" in a normal social context, when it's one ham to another, Hussein is appropriate...and, I understand, what he expects.

Speaking as a retired police dispatcher, I can assure you that it is not uncommon for officers to "run radar" with the full knowledge and intent that tripping fuzzbusters will slow things down. Sometimes on holidays, this is the SOLE purpose.

3603. Need AMT-1 help.

Newsgroup: rec.ham-radio
Date: 1990-12-02 18:25:24 UTC
From: jack@swlabs.uucp
Message-ID: <1990Dec2.182524.6662@swlabs.uucp>
Source record: 6175

I recently purchased an AEA AMT-1 interface. For those of you unfamiliar with this, it is a digital interface that does Amtor, RTTY, and sends CW. At least it claims to send CW.

Well, this brings me to my problem. The CW that it sends leaves nothing more than a character space between words. This makes reception of this abitofaproblem. :-)

I called AEA and they are less than interested in this situation since this is such an old product (not built after 1985). Of course I was willing to pay for an upgrade, if they had one, but they were not even certain that they had one. They said that the latest PROM should be marked "E1022". Mine is marked:

AMT1 `82
GPW ELEC
V01

Now my question. Does anyone have a PROM for this old beast that works for sending CW? I have ordered a CW reception (daughter?) board from Burghardt, but they claim that this does not involve a firmware upgrade. Any clues? I can burn PROMs here if anyone has a PROM image that might be helpful.

[Since this was not engineered by AEA, I am opening this article up to world distribution (specifically the UK). The PC board lists a company "GPW ELECTRONICS, LTD" and the back of the case has an address of "I.C.S. ELECTRONICS, PO BOX 2 ARUNDEL, W. SUSSEX ENGLAND". Anyone know the genealogy of this product?]

In article <378@ka2qhd.UUCP> kd2bd@ka2qhd.UUCP (John Magliacane) writes
an otherwise excellent tutorial on Keplerian orbital elements. However,
there are a few minor errors.
>ECCENTRICITY: (0..1)
>
>A dimensionless term used to describe the "flatness" of the elliptical orbit.
>A circle has an eccentricity of zero. A line has an eccentricity of 1.
>The orbit of OSCAR-13 has an eccentricity of about 0.7.

Actually, a parabola has an eccentricity of 1. A line has an eccentricity
of infinity. Orbits with eccentricities between 1 and infinity are
hyperbolae. (The Voyager 1/2 and Pioneer 10/11 spacecraft are in hyperbolic
orbits with respect to the sun, i.e., they're on solar system escape
trajectories.)

>ARGUMENT OF PERIGEE: (XXX.XXXX degrees)
>
>The angle between the line from the Earth's center to the satellite's point
>of lowest altitude (perigee) and the line from the Earth's center to the
>point where the orbit crosses the equatorial plane, going north.

The angle should be measured the opposite way (i.e., from the ascending
node to the perigee point, not the other way around). Also, the angle
is measured in the orbit plane.

>MEAN ANOMALY: (XXX.XXXX degrees)
>
>The angle which specifies the position of a satellite in its orbit, measured
>from perigee.

No. This is "true anomaly". Mean anomaly is a somewhat artificial
value; it's actually a measure of TIME since perigee, with that time
value scaled so that 360 degrees represents one orbital period. Mean
and true anomaly coincide only at perigee (0) and apogee (180) except
in the case of a perfectly circular orbit, in which case they are
always the same.

>Some satellite tracking programs use SMA as a replacement for mean motion.
>The quantity (1440/MM) yields the anomalistic period of the satellite (in
>minutes between perigees).

Note that this is not recommended practice. Small errors in computed
SMA result in bounded errors in computed distance to the satellite (which
most hams don't care about, except for those doing ranging) while small
errors in computed mean motion can result in unbounded errors in

satellite position along the orbit as time increases. Therefore it's better to use mean moton as input to the program and have it compute SMA internally rather than the other way around.

>ORBIT NUMBER: (XXXXX)
>
>The number of perigees the satellite has experienced at the reference epoch.

This figure has probably caused more confusion in the amateur community than any other, mainly because the figures included in the NORAD/NASA bulletins are so often wrong. Some agencies count orbits as ascending nodes (south-to-north equator crossings), others count them as perigee passings, and because of continuous changes in the argument of perigee caused by orbital perturbations (chiefly the earth's equatorial bulge) these number diverge after some time in orbit.

Phil

3605. Re: SAREX Operating Schedule in UTC

3606. Novel, SIMPLE RTTY

Newsgroup: rec.ham-radio
Date: 1990-12-02 20:33:34 UTC
From: gene@uicsl.csl.uiuc.edu
Message-ID: <1990Dec2.203334.20845@ux1.cso.uiuc.edu>
Source record: 6165

This rather simple idea is proposed for perhaps two types of groups.....
..those who have become a little bored with their ordinary SSB QSO's and schedules and are curious to try RTTY which is uncomplicated and VERY CHEAP to play around with, and perhaps a younger group who are necessarily limited to a low budget. The former group would include a large number of retired hams who have excellent transceivers, likely to have "buddies" that they frequently chat with, and have plenty of time during non-QRM hours, but also would enjoy the simplicity of this approach.
The idea is to simply utilize a low-cost 0 to 300 baud, ASCII modem and operate on 110-baud (standard Bell 103). It ordinarily uses two sets of tones... 1070, 1270 and 2025, 2225 Hz. We however, will only use 2025 (space) and 2225 (mark). Note that the "higher tone" is the "mark" which is opposite the usual ham-RTTY convention.
The modem (pair) that I recently used to check out the system was a VERY ATTRACTIVE BARGAIN in the two most recent issues of "RUN" Magazine which is a magazine for Commodore Owners. It is offering a close-out of Commodore Model 1660 0-300 baud modems for $10 plus $3.50 shipping. It is a high-quality modem that includes a 5 1/4" disk with two excellent "terminal programs". An excellent user's manual is also included. So this modem is especially attractive for Commodore-64, 128, or Vic-20 owners. The disk that comes with it will allow pre-recorded messages to be "up-loaded", i.e. automatically sent out over the air at 110-baud, and incoming messages, or QSO's can be captured in the computer memory and re-read, or printed out later if desired.
Also, of course, the simplest of "terminal programs" can be used if desired, and there are many public domain ones around, or a simple, short "basic language" program can be hand-typed in.
They say the supply is limited and can be ordered by phone (credit-card) at 1-800-343-0728, or by mail at: RUN Modem Offer, 80 Elm St, Peterborough, NH, 03458.
This modem has the convenient (for our purposes) manual switch to change from "Originate" mode to "Answer" mode....so our simple little trick is to Xmit in the "Ans" mode (which Xmits the 2025, 2225 Hz tones), but then when we switch to Rcv we must also switch the modem to "Originate" mode so that it will be receiving on the same 2025, 2225 tone-pair. The modem is just a little too "smart" for us as designed since it only turns on the Xmit tones when the computer takes it "Off-Hook". To avoid this complication, it can be forced to Xmit at all times in the "Ans" mode by prying off the plastic case....cut the conductor to pin "J" and ground the conductor that previously went to "J" (don't ground pin "J". If you don't have a diagram, pin "J" is across from pin 8 on the 24-pin connector. (All four end pins, 1,A,12,N are ground).
Although I don't think it's necessary, I also disabled the "Carrier Detect" line by cutting the conductor that went to pins H & K, and this time, pins H & K get grounded but not the conductor. (Pins H & K are directly next to pin "J" on opposite sides.....across from pins 7 & 9).

The conventional telephone connection (only the red & green wires are used) to the modem (USOCRJ11C) puts out a pure sine-wave of
approx 500 mv P-P which is too much since we will be switching this into the microphone input during Xmit. I attenuated this about 20:1 with 10K/510 ohm divider network. This was a good level for my ICOM-751, and my friend's ICOM-725 . At this early stage, we used a small DPDT toggle switch to simultaneously key the Xmtter as the modem telephone line was transferred from the Rcvr audio out, to the Microphone input connection.....which requires that the Orig/Ans switch on the modem must also be switched manually. If we play with this scheme much longer we will probably extend wires out from the modem switch and have a second DPDT sw alongside the first one so that they can easily be switched together. In the Rcv mode, we did not use a gain pot....only a 2.2K series resistor was used to reduce the Rcv audio level into the modem. Actually, I used a small 600:600 ohm isolation xfmr between the modem phone-line and the transceiver DPDT switching, but I don't think it would be required.

TO THIS POINT, this would appear to be Commodore-computer oriented,
BUT THE FACT IS that my friend didn't have a Commodore. We both did have, however HAZELTINE 1500 computer-terminals. These and similar terminals are beginning to appear at reasonable prices.

This is already too long, so I won't mention the modification details that were done to the Haz-1500 except to say that it is quite easy and only 4 resistors, 1 transistor, 2 zeners, and 1 diode were used....all concentrated near the "AUX OUT" 25-pin connector which is seldom used and has about 20 unused pins... only two conductors were cut (related to the AUX OUT connector and probably never needed) and this included a "reversing" switch for RCV.

By the way, the modem gets it's power from the Commodore computer in the first case, and from the Haz-1500 in the second case (Modem basically will require + and - 5 volts).

I probably should remind some readers of some underlying factors in this experimetal proposal: first, I will confess I have only recently tinkered with any RTTY so may be naive on some things that may raise some eyebrows among the pro's This is not intended to compete with the high-tech state-of-the-art with all it's error-correcting, auto-copy etc., but perhaps it might attract some who have not up until now ventured into RTTY.

This is ASCII, and practically all the ordinary, simpler QSO'S are on 45.45 baud Baudot with 170 Hz shift (ours is 200 Hz). I believe the bandwidth required for our 200 Hz, 110-baud is 200+(2 x 110)= 420 Hz, compared to 170+(2 x 45.45)=261 Hz. Note that conventional RTTY tones are 2125(mark) and 2295 (space). By the way, this system works at up thru 300-baud also. As most are probably aware, this method of putting audio-shifted tones into the microphone input of an SSB transceiver, is just a trick way of imitating the conventional cw carrier-shift method (FSK). Assuming that sideband suppression and carrier-suppression is proper, the person receiving you will not be able to tell which method you are using. Remember, however, that your actual transmitted mark-carrier is 2.225 Khz higher (on USB), or 2.225 Khz lower (on LSB) than what your transceiver digital readout says. Thus if you wanted to invert your tones by changing sidebands, your dial readout would have to be

shifted 4.450 Khz to keep your mark tone on the previous frequency. (This does not apply if you are talking to someone using this same experimental system). To avoid all these considerations, I will probably later modify the modem further to include a couple of simple inverters and separate switches for either, or both Rcv & Xmit. Two sections of a CD-4007 CMOS operating on +5 volts seems like an easy solution....crudely included within the modem case. By the way, the 1660-modem takes pos-logic data IN on pin "M" (across from pin "11") and sends OUT pos-logic level on pins "B,C" (across from pins 2 & 3). +5 volts goes to pin"2", but you will have to patch-wire in your -5v to IC pin-4 of the LM-358 (IC-2). Alternatively, you can put approx -9v on the Neg-lead of C-4 which then goes thru a small pass-transistor which drops it to -5v. If the modem will never be plugged into a Commodore computer, you can steal pin "11" to send this Neg-voltage in.

If any group should adopt this "modem-type" approach....note that every thing works out perfectly....it's just as simple as getting on "voice SSB" on exactly the same frequency. With all the excellent transceivers in widespread use, there need be no frustration or tuning indicators required. The only need would be for users to sharpen up their skills in getting their transceiver precisely on frequency (there are neat tricks to to be able to calibrate to WWV and get on freq to within about 10 or 20 Hz. easily and quickly)...they should probably use a convention of always operating on a full Khz (no fractions) so that signals could be easily tuned in.

I haven't been able to find anyone on simple ASCII to check it out but I'm told that most conventional RTTY with 170 Hz filter-separation would most likely do a good job of copying a 200 Hz-shift signal. (Note that their rcvr only needs to be tuned slightly differently to accommodate the different tone-set. Probably "RIT" feature would be used to reconcile any Xmt/rcv discrepancy.) Actually, probably a very large number of RTTY people have versatile enough equipment that DOES HAVE the
capability of communicating on 110 baud ASCII...it just seems
that most of them have been bound by convention. If you persist long enough calling CQ you will probably find someone curious enough to finally figure out your mode and switch over to make a QSO. (the later equipment does this for them automatically). I did this recently with some other 110-baud ASCII and finally did have someone get on the same mode and we had an excellent QSO. (Perhaps if this new group develops, they could call their CQ's in a very deliberate "quirky rythmn" so that they could be easily identified.)

Incidentally, using our conventional 2.1 Khz SSB voice filters (No optional filters switched in), we can get absolutely perfect copy here in the midwest from W1AW when the band conditions are very good....both 40M & 20M.
(we get them on USB instead of the conventional LSB....presumeably because our mark-tone is the higher frequency (not the ham convention). Of course we could simply reverse our Rcv switch. W1AW sends
plain ASCII at 110-baud, 170 Hz shift.
However if you have additional bandpass features, your transceiver can can enhance performance under more adverse conditions. My band-pass-tuning on the ICOM-751 becomes an excellent 800 Hz bandpass filter on either sideband. Also my optional 500 Hz CW filter is excellent.

As posted in QST Magazine, W1AW sends teleprinter bulletins 3 or 4 times a day using ASCII and 110 baud, but they are very short spans (perhaps 10 min).

Other brands of low-cost modems abound, no doubt, but you would have to figure out any changes required. I have in the past done a similar modification to some "Total Communication" package modems similar to this one but I will not prolong this posting any further.

Now that we're on the subject of Zepp antennas ... it is OK to have
the top part of the antenna slope at an angle, like an inverted V? That's
the setup I have. So far, it seems to work OK.

>that's a shame.
>
>Phil

As I understand it, the third party restrictions were put in at the insistence of foreign Post and Telegraph administrations. Communications is a government monopoly in many countries and they were afraid of competition cutting into their revenues. Many refused to support amateur radio at all unless the anticompetitive restrictions were included. The time has long past when amateur radio could make a significant impact on commercial telephone traffic, but we continue to be saddled with historical artifacts in our regulations. Write 100 times, I won't mention Morse. :-)
Except for their obligation to uphold international agreements, the FCC couldn't care less about third party traffic. With the growing demand for

VHF/UHF/SHF spectrum, and with the declining interest in HF by commercial interests, expect amateur radio to go the way of CB. Amateur radio may wind up relegated to the worthless "skip" bands and roundly ignored. This may make the DXers and pseudo-broadcasters happy, but experimenters will become nearly extinct. Pity we don't have the numbers to be a political force in the decisions that will shape our future.

What is his nickname? I vaguely recall reading that he uses some ordinary
English nickname rather than Hussein.

But then to a Swede, to see a porn movie or a regular move where the girl is called Bo Derek can be very confusing. To some cultures the question is whether Bo or Derek is the given name. There may be some CW ops who fantasize that Derek has blond hair, blue eyes and a reasonable pair of 36Cs. This may account for his success in nabbing the DX.

I just wish people would not come back to me as "Juliet". One station did it to me for three years.

Then what are we going to do with all the Kims, Leslies, Robins and for total confusion Jeans. Then we have all the Hippy names like: Free, Chastity, Moon Unit, Dweezle, Keefer, and Quinn. The sex of these names is anyones guess.

This at least is a change from the usual CW flamage.

>Didit.
>
I would assume that what would be used in CW is "Chinese Code". In
the TELEX world, there is a code book that assigns a 4 digit number to
each Chinease character. This way a simple baudot machine can send
Chinese. Of course in the old days of 3 In 1 oil and TELEX machines,
this translation to and from was tediously done by hand. I assume
today that a simple piece fo software running on a graphics machine
like a Macintosh could do it on the fly. Fifty baud is not really
flying, so any machine should be able to keep up.

TELEX for those of you who have not seen the clanking monsters that
sat in the back of every self respecting European office is landline
RTTY. Same machines, same protocol.

Now I making an assumption. Maybe someone really knows what the
People's Liberation Army of the PRC really uses for CW purposes.

3618. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-12-03 05:21:56 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901202222157.22600c82@HG.ULeth.CA>

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
December 01 to December 11, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 25 NOVEMBER TO 01 DECEMBER.

Solar activity over the past week was low to high. The most significant event was a major class M7.5/1N flare which erupted at 23:17 UT on 26 November. This flare was accompanied by minor radio emissions and was accountable for a low to moderate intensity SID/SWF at 23:12 UT. The flare was located on the extreme western limb (N18W90) within the confines of Region 6368. The duration of the flare was 17 minutes, which is below average for flares of this intensity. No proton enhancements or shock-related frequency sweeps were observed from this energetic event. The flare did not produce any terrestrial impacts aside from the short-duration SID/SWF which accompanied the flare on the sunlit side of the earth.

Since 26 November, there have been only two low-level M-class flares, one from Region 6377 (which has now rotated beyond the west limb) and the other from an uncorrelated position on the solar disk. This last M-class event was a long-duration class M1.2 event lasting 1 hour and 23 minutes. Although the source for this flare has not been determined, evidence seems to indicate that it probably originated from new Region 6395, which rotated into view on the eastern limb on 01 December. This region has a relatively large spot area, encompassing a total of 10 sunspots as of 01 December in an FKO type optical configuration. It is a type Beta magnetic group (bipolar) and is not expected to be a very prolific flare producer in its current state.

The solar flux reached its apparent minimum value of 157 for this solar rotation on 26 and 27 November. This minimum flux value is the highest minimum to be observed since the rotational minimum of 06 and 07 August, which was followed within two weeks by a pulse of increased solar activity and major flaring.

The geomagnetic field was mostly quiet throughout the last week, with the exception of 27 November when a burst of major storming occurred over middle and high latitudes. Boulder reported an associated A-Index value of 35 at 18:00 UT on 27 November, which surpasses all previous middle-latitude magnetic perturbations up to 10 and 11 October, when geomagnetic activity managed to push Boulder's A-index values up to 44. More frequent and intense storming occurred over high latitudes, although the overall geomagnetic

activity was relatively short-lived. By 28 November, the magnetic field had returned to predominantly unsettled levels and quickly declined to quiet levels for the remainder of the period.

Some periods of auroral storming occurred over high latitudes during the burst of magnetic activity on 27 November. Middle latitudes witnessed increased auroral activity, but no major auroral storming materialized. Low latitudes were unable to spot auroral activity, which remained confined to the high latitude regions.

HF radio propagation remained mostly normal throughout the week, with the exception of increased magnetic and auroral activity on 27 November. Significant auroral-induced signal flutter was observed over many middle latitude locations while high latitudes experienced characteristically poor to very poor auroral-degraded propagation conditions. However, HF conditions improved quite rapidly to near normal levels on 28 and 29 November.

There were a few flare-related SID/SWF's this week which are suspected of producing degraded HF propagation conditions. However, almost all of the SID's/SWF's which occurred this week were of low intensity and short duration (with the exception of the estimated 1.5 hour low to moderate intensity SID/SWF of 01 December. No significant VHF enhancements were observed from these SID's/SWF's.

VHF propagation was near normal this week. There were no known reports of DX contacts made via auroral communications, although there were brief bursts of activity which could have been capable of providing localized VHF backscattering to moderate distances. The rapid stabilization of auroral and geomagnetic activity did not provide very good opportunities for auroral-based DX on VHF.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low over the next week, barring any new major activity centers rotating into view. Region 6395 will continue to provide subflaring and occassional C-class flares. However, this region does not currently appear as though it will be capable of producing many (if any) M-class flares. The next potentially major pulse of activity is expected between 11 and 12 December when old Region 6368 returns.

Geomagnetic activity is expected to remain mostly quiet to unsettled this week. There is a risk of unsettled to active periods occurring on or near 05/06 December due to recurrent effects. High latitudes may experience some brief bursts of minor storming with this activity. However, overall, activity is not expected to be particularly strong. Conditions should return to mostly quiet to unsettled levels by 07/08 December.

Auroral activity will remain at low to non-visible levels until 05/06 December, when increased solar corpuscular emissions are expected to produce moderate levels of auroral activity at high latitudes. Middle latitudes will likely only witness low levels of auroral activity with possible brief bursts of moderate activity low in the northern horizon near local midnight.

Lunar phase will interfere with attempts to view auroral activity this week. The moon, which is at full phase now (on 02 December) will flood out much of any observable auroral activity over low and middle latitudes. High latitudes will be best positioned to view auroral activity after moonrise. However, even there, any auroral activity will appear less distinct and somewhat harder to spot. As the week progresses, moonrise times will allow for some short-periods of moon-free evening-twilight observing periods.

HF radio propagation conditions should be mostly normal throughout this week. High latitudes will experience degraded conditions with the onset of expected increased geomagnetic and auroral activity near 05/06 December. Middle latitudes will likely also experience periods of degraded conditions, particularly during the evening/night hours of 05/06 December. Daytime propagation over middle latitudes should be normal throughout the week. Low latitudes should maintain normal propagation conditions all through the week provided signal paths avoid the northerly-middle and high latitude regions during the evening/midnight and early morning hours.

VHF conditions should remain normal this week. No significant opportunities for DX are expected this week. The only possible exception to this would be on 05/06 November when increased auroral activity may allow for some limited localized and sporadic auroral backscatter propagation on VHF. However, activity is not expected to be intense enough to provide widespread backscattering from most high and almost all middle latitude stations.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 02 DECEMBER

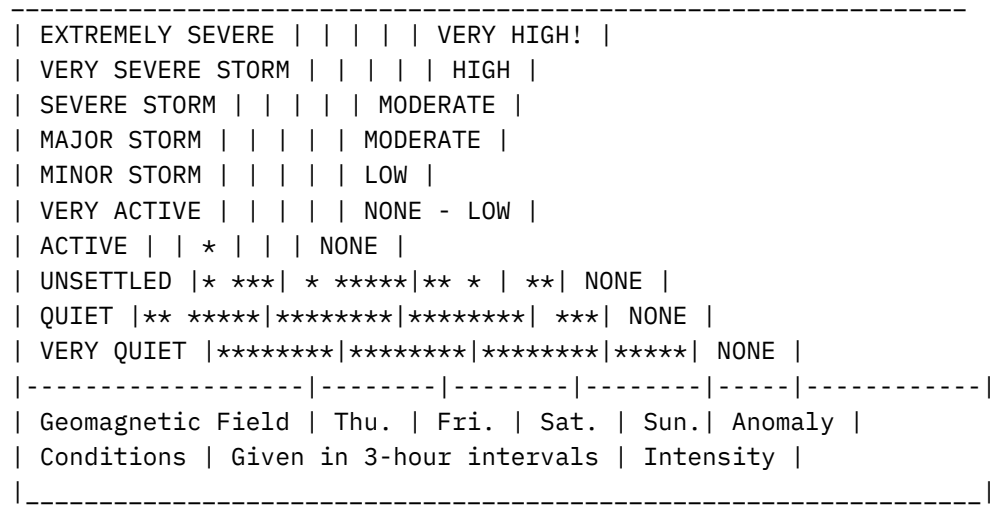
GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours



NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca. This document is still being prepared and is not yet available.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (02 DECEMBER - 11 DECEMBER)

3619. Info wanted on TH-27A

Newsgroup: rec.ham-radio
Date: 1990-12-03 05:47:28 UTC
From: woof@hpfcmgw.HP.COM
Message-ID: <1690055@hpfcmgw.HP.COM>
Source record: 6168

I'm a pilot, in the Civil Air Patrol, and studying for the Novice
and Technician class amateur licenses (to get me into 2m FM).
I've been looking at the Kenwood TH-27A, because it receives
aviation AM in addition to its 2m capabilities. I have a few
questions you all may be able to answer:

* Compare and contrast its feature set, reliability, warranty, and user
interface with the IC-2SAT, which I'm also considering. For example,
the Kenwood has a separate AM circuit block, but the ICOM relies on
its FM circuitry to decode the AM -- is this Good or Bad?

* Should I buy a different antenna for it? If so, which one?

* Who's currently offering this for the lowest price? HRO in Denver
has it for $359.95, but allegedly matches anybody else's price.

* Has anybody figured out any mods on this radio (how I can enable it to
xmit on CAP frequencies all by myself, can I connect it into an
aircraft intercom, etc.)? I'm calling Kenwood this week to see if I
can purchase a service manual -- will that include mods?

Email would be great, and I'll summarize.

3621. Re: morse code. (How would you handle Chinese characters?

Newsgroup: rec.ham-radio
Date: 1990-12-03 06:29:28 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <16643@csli.Stanford.EDU>
Source record: 6031

Rfc@briar.philips.com (Robert Casey), kchen@apple.com (Kok Chen), and julian@bongo.uucp (Julian Macassey) ponder:

>>> ... how the Chinese would do a code ...

>> ... possibly have used PinYin ...

> ... there is a code book that assigns a 4 digit number to each
> Chinese character ... in the old days ... this translation to and
> from was tediously done by hand ...

In mainland China (the People's Republic of China), they do it by the four-digit code method, although pinyin is also common. Pinyin itself is insufficient to spell out proper nouns (such as people's names and addresses) which sound the same but are written different. An analogy might be spelling "Ann" and "Anne" as both "an", and "Stephen" and "Steven" as "steven".

Telephones are scarce in the PRC. A residential phone costs more than a regular worker's monthly pay. If you work at an office (say a bank) you get to use the official phone for private conversations, at least for receiving calls. Otherwise, if you're in a hurry, you send telegrams.

To send a telegram, you go to the post office. You write out the letter in longhand and give it to the clerk. There are about two to three thousand Chinese characters in common use. At every post office in the PRC, there is a clerk who has memorized the entire four digit code table. He takes the message, and immediately starts sending it to its destination. At the receiving end, another clerk writes down the message as it comes in, and hands it to a delivery person who then takes it to its addressee. All in all, extremely efficient and impressive.

Why, you may ask, do they take such pains? One reason is lack of technology, another is an unwillingness to replace man with machine. But there is a historical reason as well. China has undergone many dynasties, some harsh, others cruel. During the current regime, people have witnessed again that one may lose jobs due to ideological reasons. If you have technical skill that cannot be readily replaced, however, you tend to survive purges. So memorizing four digit codes for a couple thousand characters is a sound investment.

Incidentally, there are people in police departments who know the license plate numbers and owners of vehicles registered in their precinct by heart. Another useful skill.

3622. Call for Discussion: rec.ham-radio.legal

Newsgroup: rec.ham-radio
Date: 1990-12-03 08:50:48 UTC
From: jmaynard@thesis1.hsch.utexas.edu
Message-ID: <9011302154.AA12661@turbo.bio.net>
Source record: 6038
Cross-posted to: news.announce.newgroups,rec.ham-radio

GROUP NAME: rec.ham-radio.legal

MODERATED: No

PURPOSE: The group is intended to provide a place for discussing any and all subjects having to do with laws, rules, and regulations affecting amateur radio and hams, both current and proposed.

The rationale for the group is simple: rec.ham-radio postings fall into two categories - controversial and non-. There has been much discussion in the past several weeks about what to do with the seemingly never-ending flame wars over the same few subjects, such as whether or not a class of license that doesn't require passing a code test should be created; the legality of modifying ham equipment to transmit out of the amateur bands; the permissibility of using electronic equipment on airplanes; and other issues that generate more heat than light. These discussions share one thing in common: they all relate to the rules and regulations governing the amateur radio service.

The new group has been discussed in rec.ham-radio, and, by and large, has received no serious opposition. Most comments received that did not support the proposal instead suggested a rec.ham-radio.tech group, for technical ham radio discussions. I do not believe that that's the best answer. There are a number of activities in ham radio that are not technical in nature; a rec.ham-radio.tech group would move the technical discussions away from the controversy, but would leave the non-technical, but non-controversial, discussions in with all the legal and controversial ones. The proposed rec.ham-radio.legal group doesn't suffer from this flaw. Agreement is pretty general among the readers of rec.ham-radio that something needs to be done, and I (and many others) feel this is the best solution.

The Call for Discussion is being mailed, per the Guidelines for Newsgroup Creation, to the moderator of news.announce.newgroups on Friday, 30 November 1990. Assuming that it is posted to that group on Monday, 3 December, the discussion period will last for 28 days, ending on Monday, 31 December 1990. If a vote is appropriate after discussion, it will be called for at that time. I anticipate that such a vote would run for 21 days, from 31 December 1990 until 21 January 1991.
Please note that voting is not appropriate at this time; calm, reasoned discussion is. Please post any discussion you may have, pro or con, to news.groups.

3624. Re: Antenna Matching

Newsgroup: rec.ham-radio
Date: 1990-12-03 12:17:58 UTC
From: dstock@hpqmole.sqf.hp.com
Message-ID: <410014@hpqmole.sqf.hp.com>
Source record: 6174

Yes I was guilty of loose use of terms. With an antenna fed with a single type of feeder of low loss, the impedance seen at the feedpoint varies with feeder length but maintains a constant VSWR and return loss. On a Smith chare normalised for the feedline Z, the actual impedance moves around a circle centred on the centre of the chart. While changeing the length of your feeder vill not affect the value of your VSWR, it is a useful trick to allow you to avoid values of Z which may not be matchable with your specific ATU. ATU's cannot match all impedances at all frequencies and have zones where they are useless. Further, they have ranges of Z where their efficiency can be surprisingly low. Sometimes a change of feedline length can allow you to use your ATU more efficiently.

The original G5RV is a special case, The coax run was supposed to be of 75ohm cable, and the open feeder of 600ohm. By playing with the lengths of both parts of the feeder, the feed point VSWR can be affected. The reason is that we can move the endpoint inpedances around two circles; each on a differently normalised smith chart. However, this is very much a compromise trick used only in the original G5RV design. The commercially available antennas are similar, bur they tell you to use 50ohm coax.

If you can run the flat/open feeder into the shack and use a balanced ATU you'll find you can get away with murder :-)

Hope you're getting all the info you wanted :-)

>(Cyrillic).
>Will someone also explain what a "Oblast" is. Is it some zone-dividment in
>USSR? If so -- How many are they and how do you express them in CW?
>Any short-form (eg. OBL).

Certainly the ARRL-Handbook does contain the Cyrillic cw.It is surprising
just how easy it is to pick-up the cyrillic code,and certainly can give
the op at the other end a pleasant surprise too!It is interesting to note
that Soviets actually use the standard abbreviated English for many of the
shorter contacts with each other, I was once amused to hear a UA3 sending
'cheerio' to a UA9! Another surprise I had was when in the radio op's seats.
in an Aeroflot transport plane earlier this year(as a guest) I heard the
op when requesting the weather at tthe destination send 'pse wx' (yes , cw is
still used on Aeroflot transport flights in the Arctic as the major mode
of communication), and he couldn't speak a word of English.

Regarding 'oblasts',they are basically administritive regions in the USSR,
and there are something in the region of 180 of them, although they do
appear to keep changing which makes it a little difficult to keep track!
There is a full list of the oblasts in the ARRL Operating Manual, and it is
generally easy to tell in which oblast a station is by his call(number and
first letter of suffix).The abbreviated form oft he word commonly used is
OBL.,and in cw OBL is the same in both English and Cyrillic.The full word ,
oblast , would be sent as 'oblastx'.

Hope that's of use.....

The 100th Anniversary of Major Edwin H. Armstrong

Major Edwin Howard Armstrong, famed radio pioneer was born on Dec 18, 1890, and fell to his death on Feb 1, 1954. He is credited with being one of the most important inventors in the field. Among his inventions are four basic discoveries that revolutionized radio, and made possible the present state of the art. These include: the regenerative circuit, which took radio out of the crystal detector stage; the superheterodyne circuit, the basic circuit of today's standard radio; the superregenerative circuit, used in military and UHF communications; and the FM communications systems which achieve static-free high fidelity reception. He attended Columbia University, and became Professor of Electrical Engineering at the school.

The members of the Major Armstrong Memorial Amateur Radio Club will be commemorating the 100th anniversary by operating Special Events stations December 15th and 16th from 1400Z to 2300Z on the following amateur bands:

10 meters--- 28.400 Mhz +/- 25 Khz on SSB.
2 meters--- 145.03 Mhz Packet Radio with the call of W2FMN which may be reached via the K2LSX-2 NetRom Node.
220 Mhz----- 223.42 Mhz Packet Radio with the call of K2LSX which may be reached via the K2LSX-3 NetRom Node.
Club Voice Repeaters located in Northern New Jersey:
222.080 in/223.680 out W2VH/R with PL 1B (107.2).
222.640 in/224.240 out W2QAQ/R with PL 1B (107.2).
441.525 in/446.525 out W2VH/R with PL 1B (107.2).

Members will be using their own call signs. Special Certificates will be available for those making contacts with a member station. To receive a certificate, send a completed QSL card and a 8-1/2" x 11" SASE to:

MAMARC
100th Anniversary

The FCC never busted any police departments back east. The only involvement I ever heard of with teh FCC and Police Radar was a complaint filed by a truckers group about police in Oregon setting up old defective radar units along the highway with solar cells. These units would still transmit but not receive. The units would then trigger the detectors in areas the police considered as hazardous, and caused traffic to slow.

The FCC became involved and the 2 (maybe 3) police departments discontinued the practice.

It is currently policy in at LEAST one state police and many local police departments to LEAVE RADAR ON during a traffic stop. This has been statistically shows to SIGNIFICANTLY reduce the number of officers injured during trafic stops. The FCC is mute on this, as well as various motorist groups, at least so far.

Source record: 6050
Cross-posted to: news.groups,rec.ham-radio

The notion of a separate group for legal/rules issues of Amateur "Ham" Radio seems to be a good one. Certainly it is an appropriate split of existing traffic.

I wish that there would be a smallish reorganisation of the whole Amateur Radio heirarchy to move it to be of the form:

rec.radio.amateur.*

rather than the existing

rec.ham-radio.*

The reasons for this are several:

1) The existing name predates the other rec.radio.* groups and getting the Amateur Radio area more consistent with other groups on similar topics helps make it easier for folks to find and post to the correct groups.

2) The net is sent world-wide and has much more international traffic than it did several years ago and many net.readers aren't familiar with jargon words in English like the term "Ham Radio" to mean Amateur Radio. The use of Amateur Radio avoids the use of jargon and makes it clearer to all folks what the topics of discussion are there.

Perhaps there could be an independent vote on renaming the heirarchy piggy-backed onto Jay's proposal so that the two ideas would be voted on separately as part of the same ballot. I don't know how Jay feels and my idea is very much a trial balloon, but I'd like to at least see it be thought about by the interested parties...

Regards,

Randall

I have one and overall am quite impressed.
Yes indeed you can use the radio as a crossbad repeater/remote base, but
there are a few "gotchas". You can do the same with a number of other rigs
too BTW and you might well find a cheaper one if that is the only thing
you really are after.

{ I called Alinco and got the following disappointing story.
{ Almost everything can be controlled remotely including power
{ level, crossband repeat on/off, frequency and memory recall.
{ The bad news is that the transmit offset cannot be selected.
{ (I never did get an answer to whether the rig automatically
{ choses offset on 2M. The guy said that "most repeaters in
{ the US have - offset.")

Your info is correct, but you DO need a $40 "DTMF control" option to do
this remotely, but you can do this from the DTMF mic. "out of the box".
Testing the functions using the local mic. can save you a lot of trouble
in getting set up!

The functions are 3 digit codes starting with a hex C (16 button
DTMF). The functions (in order) are: Cancel, VFO mode, Memory mode, CALL
mode, ARM mode, VHF main band, UHF main band, power level, up one Mhz, Down
one Mhz, set DSQ code, select DSQ code, set autodiater, select autodialer,
transmit autodialer.

{ The Alinco guy's suggestion was to use the Memories instead.
{ (i.e. have all your favorite repeater freq's stored in memory
{ which does remember offset.) Only problem there is that the
{ memories can be selected only using "next memory up" and "next
{ memory down" control functions. There apparently is no "go to
{ a particular memory" function. This is OK until you forget
{ where you are.

I assume that "next memory up/down" corresponds to the "one Mhz up/down" in
remote mode just like it does on the front panel. I haven't tried this.

Figuring out "where you are" is a problem with remote operation regardless
of the mode that you are in though. I don't have a simple solution.

{ I found it hard to believe that they had such robust functionality
{ but left out some critical features.

They have done this is several areas, what is there is good but with just a few tweaks they could have been "the radio of the nineties". Hopefully they (or someone, maybe the FOX-Tango group?) will issue software upgrades to fix some of this. The potential performance is truly spectacular!

{ Can anyone confirm or deny what I've stated? Anyone have this
{ radio?

I hope this answers your questions. And Yes I do have the radio :-)

My plans are to use it as a mobile and then use my IC24AT to control it as a remote. Since I will generally be in the vicinity or returning to the car frequently (at least twice a day :-)), the remote operation can be relatively unsophisticated.

A couple of other problems though: (1) to enable cross-band repeat you must cut a wire that inhibits out of band operation. BOTH TX and RX! THat could be a real problem with remote operation. (2) THere is no easy way to have a "one way repeat" i.e. UHF-to-VHF only. THe reverse (VHF-UHF) will then block out your remote if you key up a repeater with a "tail". I excpect to use the PL option for this though (another $45 option :-( ).

Overall thoough it is a really nice rig, I do hope some ambitious group decides to put together fixes for some of the silly limitations though.

{
{>1) How do I answer a CQ? I hear a guy calling CQ, and I want to answer him,
{>but how? What do I send? Like I say, I'm pretty ignorant.

[a lot of good suggestions deleted]

{15 meters is good during the day, and sometimes to surprisingly late into
{the evening. Since you have an advanced ticket, you can use any HF band
{you want--just call CQ at a low speed. Just about everyone will try to
{match your speed when they answer you. Or search for someone else calling
{CQ at a speed you can copy. You'd be surprised at how much slow-speed
{CW activity there is, even on 20 meters.

One point you should find quickly by listening a while, but is still worth
mentioning, is that there is a general convention for speeds to get higher
as one goes towards the low end of a band. Not a "hard and fast" rule, but
dont try calling CQ at 10 Wpm on 14.026 for example (or 14.005 for extras).
You will find the speeds and general sophistication MUCH higher there than
at say 14.110. For your first few CW QSOs though the 40/80 meter novice
bands are hard to beat, just don't be afraid to try other frequencies once
you get the hang of it!

If you are persistant enough to learn to do it well I think you will find
that CW has some VERY unique advantages that make it a whole lot of fun.

Oh yes, after all that I STILL favour a no-code license! THere is room for
both IMHO.

Someone asked where to get the EDMEESE program. (I lost the message, so I can't reply by e-mail.) Anyhoo, it's widely available on Fidonet type BBSes and deals with the Fidonet FTS-0001 format messages. An equivalent for Unix boxes ought to be easy to put together with AWK.

However, for those who ARE using FTS-0001 format, I'll pick up up a copy of EDMEESE.EXE pass it along using e-mail and uuencode to those who request it.

From: JORDAN@LL.MIT.EDU
Message-ID: <9012031322.AA28474@LL.MIT.EDU>
Source record: 6055

I had a lot of fun in the Un-Net this Saturday. Many thanks to Alan, K6XO for his sterling work as net control under some very difficult conditions. We experienced some very variable propagation, as well as some very confused non-net hams who kept checking in (& out !) I'm only sorry I had to leave before the DX checked in, I would like to work Tobago & Guantanamo Bay on 10 sometime..

I presume the net will be pre-empted by the contest next weekend, but lets hear from some more people the week after.

I have a question about packet. If I intend to run TCP/IP, and use Phil Karn's NET-PC package, it seems that I will end up putting the TNC into 'dumb mode' and basically using it as a modem. I haven't bought a tnc yet, and it seems I don't really need one. Am I right in thinking that all I have to do is build a modem that turns 2 tones into high & low levels on an RS232 line, and connect it to the PC? (levels to tones for transmitting). Why should anyone spend hundreds of $$ on a tnc when the PC can do the work, assuming you already have one.

Can anyone point me to a circuit they have used successfully with the NET-PC program? I can probably handle the modem part, but presumably there is some handshaking protocol that has to be done correctly.

Thanks and 73

>trackers worldwide.

Actually, it was a __long__ time ago. Kepler published his work on elliptical motion in "seu Physica coelestis tradita commetariis de motibus stellae Martis" in 1609! This contained the first two laws: orbits are ellipses, and equal area = equal time. In 1619, he published "De Harmonice Mundi", containing the third law, which relates distance to orbit period. In 1620, his mother was arrested for witchcraft.

So, the basic work was done 371 years ago! This is one of the humbling things about celestial mechanics. I'm sure I wouldn't have been able to figure this out, yet Kepler did it 371 years ago. Obviously, he didn't have computers. Most people don't realize that he didn't even have the benefit of a telescope. The telescope was invented around 1609; Galileo pulblished in 1610. The observations that Kepler used to develop his theory were made by Tycho Brahe, many years earlier.

I was just informed by the SAREX coordinator at ARRL that NASA plans
to show some video of Ron Parise's amateur radio activities this
Thursday evening.

Scheduled time for "Mid-deck activities: SAREX" is 6:04 p.m. PST
on Thursday, December 6th.

Early reports are that Ron successfully talked to his dad yesterday
via a direct contact, but there were problems this morning with the
more complicated linkup between a couple of U.S. schools and the shuttle
via a ground relay station in Brazil. Cross fingers that everything gets
straightened out in time for Tuesday's scheduled school contacts. (They're
going to try to reschedule the schools that missed out this morning.)

Also, more than 200 hams have made contact with the robot packet-radio
system. I watched at 2:20 a.m. local time this morning as our own
netperson Mike Chepponis, K3MC, became contact #116. Ron is in his
sleep period now but will be starting up the robot again this evening.

What's wrong with that? At least some high government official SOMEWHERE cares
about ham radio, even if the FCC doesn't.

Besides, it'll give me a chance to come up with a cheap 2 meter all-mode rig.

>Now that we're on the subject of Zepp antennas ... it is OK to have
>the top part of the antenna slope at an angle, like an inverted V? That's
>the setup I have. So far, it seems to work OK.

You seem to have answered your own question. :-)

When dealing with nonresonant dipoles and skywave propagation arriving at various undetermined polarizations, the only practical answer is to use what works. Theory says that we want the high current part of the antenna as high and in the clear as possible to minimize losses. Theory also says we want the antenna confined to one vertical plane to obtain maximum broadside gain over a point source. Confining the antenna to one horizontal plane will optimize it for one polarization. Since we don't know the optimum polarization for a given skywave path, we aren't too concerned about this. However, with a Zepp, on certain bands the antenna will behave as two end fed halfwaves in phase. Therefore the current maxima will occur halfway down each leg rather than at the feedpoint. Keeping these points as high and in the clear as possible is important to minimize losses. And to maintain maximum broadside gain from the pair of end fed halfwaves, they should be confined to the same horizontal plane. If not, they will be cross-polarized at the Vee angle, usually 90 degrees, to each other and not exhibit maximum gain. Thus the answer is that a flattop is better than a Vee for frequencies where the Zepp is not approximately a halfwave. Again practice rears it's ugly head. If you can't mount the Zepp as high as a flattop as you can when it's a Vee, then the Vee may perform better in practice.

Few of us are lucky enough to have an ideal antenna field with no obstructions, ideally placed supports, and highly conductive ground. Thus we make do with what works given our situation. Theory reminds us what considerations are important, but only experimentation will show us what works best given our practical limitations.

Gary KE4ZV

John's right about this one. The local field office busted the DeKalb County Ga. police department for this one. They were very blatent however in that they mounted surplus radar units on expressway signs and just let them run. Their intent was to make radar detectors useless by generating many false readings. The field office busted them for transmitting false and misleading signals as well as for intentional jamming. The local field office also busted the State Patrol for failing to have transmitter ID cards attached to their radar units. The Field Engineer in Charge likes to drive fast. :-)
On a somewhat related note, the regional EPA office busted the Gwinnett County Police for illegal tampering with emission controls in order to make their crusiers run faster. Guess what EPA officer likes to drive fast. :-)

>
>Phil
>phil@ncd.com

I've fed my tower, a seventy foot Rohn 25 tower with a tri-bander as a top hat, using a gamma match. I made the gamma rods from 1/2" EMT spaced 6" from a tower leg using PVC pipe. I used three gamma rods, one each for 160m, 80m, and 40m. One rod per leg of the tower. I used remotely tuned gamma capacitors. It worked pretty well on transmit, but atmospheric noise on receive forced me back to horizontal antennas. I now use a 535 foot horizontal loop mounted 55 feet up. I feed it with ladder line and a tuner. Works nice.

Christians believe salvation comes by faith and faith comes by grace. No
amount of "doing" earns brownie points. It is a simple question of obedience:

"Go, thou, and teach all nations."

There, that isn't so difficult to understand at all, is it?

>when the PC can do the work, assuming you already have one.

It's not *quite* that simple. The packet "framing" method used in amateur packet radio is HDLC, which is a member of a class of "synchronous" link level protocols. The standard serial ports in PC type computers cannot support synchronous protocols, so you either need a synchronous interface chip (e.g., Zilog 8530) or you need to generate the output in software one bit at a time. The former method is much preferred.

You can buy cards that provide both the HDLC framing and modem functions. DRSI has the PC Packet Adaptor, while PACCOMM has the PC-100 and Hamilton Area Packet Radio has their HAPN card. A new group in Ottawa has just come out with an HDLC card that supports DMA (invaluable for high speed modems) but it does not have an on-card low speed modem.

Once you have one of these cards you should be able to configure NOS to run with it.

3658. ARRL 160 Meter Contest Results

Newsgroup: rec.ham-radio
Date: 1990-12-04 13:52:51 UTC
From: jamaass@bluemoon.uucp
Message-ID: <s3qNT1w163w@bluemoon.uucp>
Source record: 6062
Cross-posted to: rec.ham-radio,fido.ham-radio,fido.packet

November 30-December 2 marked the 21st Annual ARRL 160 Meter Contest, and for the 21st year our group participated as a multi-single station.

Our call this year was K1LT (Calls also used in the past were W8LT and K8ND), and our final results are listed below:

QSOs: 958
Mults: 85 (Missed KV4, VE5, VE8/VY1; 11 DX countries)
Score: 165,665

Operation was from the Ohio State University Radio Observatory north of Columbus Ohio, with participation by K1LT, K8ND, NZ4K, KU8E, and KC8MK.

Station was Drake C-Line (R4C heavily retrofitted) and 8877 amplifier.

Transmitting antenna was a 30-foot high top-loaded vertical mounted on a 2.5-acre aluminum foil ground plane (part of the permenent radiotelescope on the site), fed through approximately 600-feet of RG8/U.

Receiving antennas included six beverages (NE, SW, E, W, S, N) and an experimental 4-element switchable, phased, voltage probe array consisting of four 3-foot voltage probe vertical rods ground-mounted.

The above score represents more net QSOs than any of our past efforts, and about the same number of multipliers as netted last year, when we posted the top score in this contest. We know that we were beaten this year by K2WI, who posted 902 QSOs and around 94 multiplier.

Are there any other scores out there? If so, we'd like to hear about them! Please send information to me by packet (K8ND @ W8CQK) or by EMAIL (packet preferred).

>>an HT on 440 to corssband repeat onot 2meters.

>Then Mike Waters AA4MW/7 writes some junk and then . . . a number of other
>rigs [do the same thing] and you might find a cheaper one if that is the
>only thing you really are after.

Well not quite
Most other rigs dont allow the remote controll including QSY that
the Alinco does.

Mike then writes:
> couple of . . . problems . . .: (1) to enable cross-band repeat you must
>cut a wire that inhibits out of band operation. BOTH TX and RX! THat could
>be a real problem with remote operation.

This is completely incorrect. When you cut the wire it ENABLES out of band
operation.

He then continues:
>There is no easy way to "one way repeat" i.e. UHF to VHF only.

This is incorrect. If the DTMF squelch is enabled on both 2m es 440 then
the proper tone sequence is required to open the squelch and you can use
your ht to RX and your remote base to TX.

Furthermore as I posted last month, I have been working with Dexter and Greg
at Alinco and have found a way to automatically control the offset.

All (standard) repeaters below 147Mhz use - offset. All repeters in the
147Mhz sub band use positive offset. So this is how you set up the rig.

1 Store a repeter frequency (positive offset) (from the VFO) in the ARM memory.

2 enter a repeter frequency below 147Mhz and switch to - offset.

3 now when you qsy above 147 Mhz the offset will be + and below 147 Mhz will
be -. This works for all VFO functions i.e. band scan, mic-pad frequency
entry, and remote (ht) control.

If you have other questions regarding this rig let me know and I'll see what
I can do for you.

I'd be interested to know what gives you that impression. Having recently discussed some of this with the FCC, I have a different impression entirely. They are insistent that both the FCC and the amateurs themselves have the capability to detect improper use of amateur frequencies. The oft-cited continuing use of amateur frequencies by taxicabs, boaters etc. is irrelevant. There is a big difference (in the FCC's eyes, at least) between not having sufficient enforcement capability to catch all of the illegal activity and not being technically *able* to catch them. They may grudgingly put up with the former, but they are unbending about not allowing the latter to happen any more than they can help it.

You can try around the popular "QRP frequencies"
3.560
7.030
14.060
21.060
28.060 MHz

The majority of these people will make you very welcome, are happy to stick around and help you or just plain ragchew. If you can adjust your output power down to about 5 Watts, you'll make friends for life :-)

Their signals will be small, but they will be quite prepared to work locals. I find these frequencies to be oases, away from the worst of the p*** off-you-are-not-DX mentality.

some of the very best operators are to be found here.
I define a good operator as one with skill,ability, good manners and patience. (i've got the patience, the rest I've got to work on :-))
People who can do fast morse but lack the other characteristics just don't qualify.

Hi everyone,
One of the local officiers, who is also a ham, has a lot of fun with his radar unit! When he spots a car with a radar detector in the window, he likes to track the car, with the speed gun OFF! Likes to watch the reactions of the drivers trying to figure out why their detectors didn't alert them to his radar!!

Happy and safe holidays!

3665. TVI Problem

Newsgroup: rec.ham-radio
Date: 1990-12-04 16:02:58 UTC
From: sde@larry.sal.wisc.edu
Message-ID: <1168@larry.sal.wisc.edu>
Source record: 6076

I have a baffling TVI problem, and I'd like to see if anyone else has encountered anything similar. "Something" within about 150 meters of my antenna is apparently rectifying my 15 meter signal, and generating a harmonic at 63 MHz. Harmonic generation in the rig and antenna system have been ruled out. TVI only appears with the beam pointed in on particular direction, which happens to also be toward the affected television. (Fundamental overload has also been ruled out.) TVI is more severe when transmitting on either of 2 wire antennas, which are more or less parallel, with their ends pointed in the direction in which the beam causes interference. When transmitting on the wire antenna, however, the position of the beam makes no difference. The beam still causes interference with the two wire antennas down, so the wires themselves are not the source. Now the strangest thing of all: When the harmonic is observed with a spectrum analyzer, it appears to be modulated by a very erratic 60 Hz square wave (at the power line frequency, precisely), but only when transmitting on one of the wire antennas. The harmonic is much stronger using the beam, but shows no modulation. Reducing power with the beam does not cause modulation to appear. There are lots of power lines and poles in the critical direction, but a search with a portable receiver was inconclusive. Needless to say, the 15 M fundamental never shows any modulation, regardless of the antenna used. The only explanation I can think of is that a vertically polarized component induces current in a vertical ground wire on a utility pole, which may have a flakey connection which results in rectification and modulation. Since the beam is horizontally polarized, it induces current in a different part of the power lines, which somehow still generates harmonics, but without the modulation. The wire antennas, of course, have a significant vertically polarized component off their ends. (They also slope.)

Any ideas out there? I'm ready to start pounding on those power poles with a sledgehammer. Please reply be email.

I have the Alinco 570T and it doesn't require any modifications to cross
band repeat. There's a switch on top labeled "radio repeat". Just put
it in repeat and you're in business. The easiest way to handle "one way
repeat" is to use the odd split option and program memory nine for an
out of band frequency. It will refuse to transmit there. I use a FT470
and can monitor the repeater while accessing it via the "one way repeat"
of the Alinco. It's like having a 45 watt HT. CTCSS encode and decode
are standard equipment on the 570T. If you haven't bought a 590 yet,
take a hard look at the 570 first. It's cheaper and does what most folks
want right out of the box. If you don't really *need* remote touchtone
control, it's a real win.

The KISS TNC is more than a dumb modem. It does channel access control, monitoring for a clear channel before keying up. It controls txdelay and tail timers essential for packet over radio. It implements a P-persistence backoff algorythim to avoid congestive colapse of the channel. It buffers packets in onboard memory. It implements a framing protocol on the serial link. It does the HDLC framing and bit stuffing and NRZ to NRZI conversion needed to implement packets. And it needn't cost "hundreds" of dollars. Most TNC2 clones are in the $105 to $130 price range. The "hundred" dollar range.

Channel access control is vital to the health of packet channels and it's a real CPU cycle waster. You don't want to have to do this in your PC. To do HDLC you'll need special hardware in your PC because you definitely don't want to bit bang this in software, your standard serial port doesn't know how. That special hardware is an 8530 card that's going to cost $130. Which PC timer are you going to steal to do the txdelay and tail timers? What random number generator hardware are you going to use to implement P-persistence? Unless you just want to attempt it for the challenge, don't try packet with a dumb modem. It won't save you money.

3669. STS-35 SAREX Status

Newsgroup: rec.ham-radio
Date: 1990-12-04 17:21:41 UTC
From: gamorris@lescsse.uucp
Message-ID: <1990Dec4.172141.1347@lescsse.uucp>
Source record: 6006
Cross-posted to: rec.ham-radio,sci.space.shuttle,sci.space

Houston 4 Dec 90 - 17:00 UTC

There have been some success and some problems with SAREX (Shuttle Amateur Radio EXperiment) on STS-35. On the first inflight test of the bridge system (2 Dec 90 0316 UTC) we were unable to make any contact with Ron. We have confirmed that he had a weak voice contact sometime before the bridge test time with a station in Florida.

On the second bridge schedule, which was to be a realtime connection between Ron, WA4SIR, and a classroom of children on school, we were unable to establish two way contact with Ron during the pass over Sao Paulo, Brazil. We did hear him for about 10 seconds of the 10 minute pass but couldn't establish conact. The most likely cause of the weak signal is the orbiter attitude during the contact. The SAREX antenna is in the right side window on the flight deck and at the time of the Sao Paulo pass the orbiter was tail down. The orbiter attitude is determined by needs of the primary payload.

A second bridge system test was scheduled for a pass over Australia but Ron was unavailable at the time of the pass (4 Dec 90 0205 UTC) and no contact was made. Ron was also asked to attempt direct contact with W5RRR on orbit 30. This contact was successful, Roy Neil talk to Ron for about 7 minutes as he passed south of Houston. Ron said that he had heard us full quieting on the pass over Sao Paulo but we couldn't hear him. The orbiter attitude was good for this pass which confirms that the orbiter attitude is important. This pass had only a 6 degree maximum elevation in Houston, we believe elevation and range are not significant factors in making a contact with the shuttle.

The amateur radio voice contact with the Mir space station is uncertain at this time. The first close conjunction (53 km) with Mir was to occur today (4 Dec 90) but the Mir crew is unavailable for radio contact due to the docking with the Soyuz and arrival of the new crew. The next close conjunction (57 km) is about 4 hours after the SAREX stow time on Dec 11. This contact can only take place if mission controllers approve delaying the stow of SAREX and the mission is extended the extra day. Vance Brand has been brushing up his Russian language skills which he learned for the Apollo-Soyuz mission.

The packet robot has been operating on schedule (included below). As of this morning (4 Dec 90 1600 UTC) over 400 contacts have been made with amateur radio operators using packet. If you experience weak signals on the downlink, it is likely that the orbiter is in an unfavorable attitude for you. It can improve or degrade as the orbiter passes depending on which side of the orbiter is facing you. The attitude is

constantly being changed to support the telescopes, so if you experience weak signals, try again on later orbits.

Packet Robot Operating Schedule

03 Dec 90 03:19 - 16:19 UTC
04 Dec 90 03:19 - 15:44 UTC
05 Dec 90 03:19 - 15:34 UTC
06 Dec 90 03:19 - 15:49 UTC
07 Dec 90 03:19 - 15:34 UTC
08 Dec 90 03:19 - 15:44 UTC
09 Dec 90 03:19 - 15:34 UTC
10 Dec 90 03:18 - 15:04 UTC
11 Dec 90 02:49 - 14:34 UTC (only if mission is extended one extra day)

The element set (below) is from JSC based on orbiter state vector, the NORAD data is different by about 7 seconds on equator crossing times. The JSC 2 line set has 00035 for the object number, whereas the NORAD set has 20980. If you had set JSC-012, there is really no need to update to this one, the difference is small (about 10 seconds).

3670. CALL FOR DISCUSSION: rec.ham-radio reorganization

Newsgroup: rec.ham-radio
Date: 1990-12-04 17:26:04 UTC
From: paulf@shasta.Stanford.EDU
Message-ID: <19@shasta.Stanford.EDU>
Source record: 6000
Cross-posted to: news.groups,rec.ham-radio

Jay Maynard and I propose the following reorganization of the rec.ham-radio hierarchy:

PROPOSED ADDITIONS:

1. rec.radio.ham

"A General newsgroup for discussions about amateur radio."

2. rec.radio.ham.legal

"A newsgroup for the discussion of legal aspects of amateur radio."

3. rec.radio.ham.packet

"A newsgroup for discussions about amateur packet radio."

4. rec.radio.ham.swap

"A forsale group for the rec.radio.ham hierarchy."

PROPOSED DELETIONS:

1. rec.ham-radio

Now superseded by rec.radio.ham and rec.radio.ham.legal.

2. rec.ham-radio.packet

Superseded by rec.radio.ham.packet

3. rec.ham-radio.swap

Replaced by rec.radio.ham.swap

Commentary Period: Dec. 4 -14, 1990

>I must admit to, on occasions, having used 'Old Thing' as a suitably
>non-specific term.
>(but CWers would abbreviate this to OT, which has ageist implications!)
>

Of interest to some is the fact that Old Fart is somewhat unisex
which can not be said of Geezer. But then Old Fart also tends to infer
a certain mindset.

Of course here in Greater Disneyland wimin often refer to each other
as "guys". It is not uncommon to see a Valley Girl walk into a bar and
great her assembled soulmates with "Hi you guys!". Not a testosterone
producer amongst them.

This of of course points out that the gender of forms of address is
not really that important.

>about celestial mechanics...

Kepler is not the really humbling example in celestial mechanics. That honor goes to Isaac Newton, not much later. After deducing that gravity followed an inverse square law, he explored the consequences of that (including deriving Kepler's Laws) so thoroughly that the greatest mathematicians of the next two centuries basically just added footnotes to his work.

If you are using a crank-up tower, you may need to worry about obtaining
a good electrical connection between the sections. The Rohn 25 should
work fine.

I've had some experience shunt feeding towers on 160m. Crank up towers are particulary difficult to shunt feed. Unless you are willing to leave your tower fully extended most of the time I wouldn't recommend shunt feeding it. It's hard to get reliably good connections between the sections with crank ups. You might think about guying the thing at the top with phillistran non-conductive guys and leaving the tower permanently extended. Then you can bond the tower sections together and mount your shunt feed connections.

From: eyg@hpnjld.HP.COM
Message-ID: <4140026@hpnjld.HP.COM>
Source record: 5978

I worked half a dozen Maine stations last weekend in the 160m contest. Some of them had decent signals which I would think you could have heard. I worked 710 stations using an 80 meter dipole, so you don't have to have a 1/4 wave vertical to get out.

Look for KA1PE almost every evening between 1830 and 1840. He's usually chasing DX, but I'm sure he'd gladly give you a contact for WAS. He has a VERY loud signal, and you should have no trouble hearing him.

Ed, WA2SRQ

3678. Latest Callsigns?

> The FCC's major concern is not that someone might say a naughty word
> on the air. They are concerned that unscrupulous people might use
> amateur frequencies for business or criminal purposes without there
> being any means of detecting and tracking them.

If someone wants to use amateur frequencies for criminal purposes
all they have to do is go down to a Radio Shack store and buy a radio.
I would think that anyone sending e-mail to a ham on the .ampr.org
domain would be the same as my girlfriend making a reverse autopatch
on the local repeater. If I was not there to answer the call, and a
control opr was not on freq at the time, SHE would have controlled the
repeater. And this DOES happen in the REAL WORLD!! Are we to then
say that ALL reverse autopatches are to be turned off ????

I know of a local repeater system that has a special dedicated twisted
pair to the local PD so the PD can come up on the HAM repeater whithout
ham intervention. They have a 911 service on the machine and if the PD needs
additional info, they pick up the handset and PRESTO they are on the air.
this has proved to be very helpful in emergency situations.

Thanks to Phil & Gary for putting me right about what is required for a packet TNC. The handling of HDLC obviously poses a problem. I am now starting to appreciate what is involved. I was hoping a 16Mhz '386 would be able to do the job, even if it meant polling the line for individual bits.

I'm a lot handier with a compiler/assembler than I am at drilling metal, so I prefer software solutions whenever possible - they're easier to upgrade too..

In the meantime, I'll start with RTTY...

Mike

]Check this month's QST for news on what the FCC did to fellow
]netperson K1MAN. Sometimes, you do not have to wait for st. Peter.

I wouldn't hold my breath waiting for K1MAN to really be punished,
based on the following information:
1>K1MAN is a quite good amateur lawyer, having fought the FCC into
the US Court of Appeals on the AM power limitation [this information
from a former FCC lawyer who was involved].
2>It is one thing to issue a notice to pay a fine (forget the name
of the thing) - it is quite another to collect. The first is a
non-judicial administrative action. To collect if he protests,
however, the FCC has to take him to court.

On the other hand, I hope they get him. I have had some very unpleasant
personal experiences with that idiot.

I like this proposal -- it matches the naming conventions a bit
better, and (my favorite point) separates the recreational and legal
discussions (I read both, but would prefer not at the same time).

A previous poster suggested using "amateur" rather than "ham", as
it is less colloquial (hows that for the obligatory $10 word?)
-- I agree.

It seems the only effect of this reorganization is the addition of
rec.ham-radio.legal, other than the name changing.

Why is this a Good Thing? Why not just add rec.ham-radio.legal and
leave the rest of the structure alone? Is it not simpler (and prone to
fewer screwups) to do this instead of renaming everything?

SB RTTYDX @ ALLBBS $RTDX1130B
RTTY DX Notes 3of3 11/30/90

RTTY DX Notes for week ending 30th November 1990
BID: $RTDX1130B
Part 3 of 3.

Notes of Interest:

At the time of preparing these notes, nothing has been heard of the ZS9Z/ZS1 (Penguin Island) RTTY operation.

P29BT states that he will be in P29 for two years.

Kampuchea (Cambodia). The XU1DK operation by JG1RVN is on track for 3rd December. All papers and permissions are in hand. QSL to Liason Office of Coalition Government of Democratic Kampuchea, Box 80, Kotimachi, Tokyo, 102-91. Japan. He will transmit on 088 on all bands and will be listening up.

Kure Island KH7 should be activated by KD7P/NH7 from 12th to 21st December. QSL to Box 8265, MOU3, Guam Dededo, GU 96912-8265 USA.

3W3RR is still hoping for early December for the Spratley operation, but reports that he is still short of cards for his previous operation. Do not panic as he confirms that he will QSL all contacts as soon as he gets more cards from INDEXA.

King George Island. It was reported that SP3FVM was in Spain on 7th November, but a further report indicates that he was heard under a dogpile signing HF0POL on 26th November. His last indicated ETA was January. Who knows whats going on there?

UL7PCZ Alex,(RL8PYL) has reported that he is preparing for a trip to Northern Korea and Afghanistan in 1991. Keep your fingers crossed. Alex reports that the latter part of the trip will be the most dangerous. He would like some financial assistance as well.

GL DE DX1.

Hogwash. The FCC tends to abide more by "Good Amateur Practice" than anything else, and it is the populus that decides exactly what is "Good Amateur Practice". The ARRL has always espoused similarly paranoid paternalism when dealing with autopatches, despite the enormous changes in the telecommunications industry during the last decade. The net result has been informal FCC policy which is more restrictive than the written law.

Those who refuse to forsake life in the defense of liberty deserve neither. Or something like that.

3690. Powerline voltage too high, power co working on it

Newsgroup: rec.ham-radio
Date: 1990-12-05 03:37:19 UTC
From: rfc@briar.Philips.Com
Message-ID: <114172@philabs.Philips.Com>
Source record: 5990
Cross-posted to: rec.ham-radio,sci.electronics

I've had a little adventure with the powerline voltage at my parent's house. About 6 weeks ago, I was at my parents', and for some reason, I measured the powerline. (Now I remember, an old powerline volt monitor meter I had in the hamshack room seemed to be reading high. Must be broken, get out a good digital meter to check the voltage. Oh, 128V! That meter is not broken. tried another digital meter, got the same thing.) Told my father, who is also a ham.
Called the power company (your standard generic "Public Service Electric and Gas"). "No don't want to talk to billing Dept. Ah, guess I want the line to "downed wires, and other such". Talking to phone answering person: "I think my power voltage is too high." "What's too high?" "The voltage, it's a few volts too high" "Duh, well, we'll send some guys out to check out the, ah, what did you call it?" "the voltage in my house".
About a week later, a power company person with a Fluke multimeter visits, and takes the circuit breaker panel off and measures the lines. "yes, you're right, it is too high. What kind of meter did you use? That's just like the ones we use. Must be some bad capacitors on our distribution net. Have to check out the substation." Somehow, the guy broke one of the circuit breakers in the panel. Company says that they'll pay for a replacement.
Guy leaves, a few hours later, calls. "try measuring the voltage" "Still too high, 127V." "Found some bad caps, must be more bad ones. This is gonna take us a while to get this figured out"
About 4 weeks later, two guys from the power company pay a visit. They go to their kilowatt-hour meter in the basement. "We are gonna take the cover off the meter box and measure the voltage from the street. gotta break this old porcelain seal". So, they break their power security seal, the one they use to keep you from cheating on the electric bill. They measure the voltage, 128V. "We're gonna try a house across the street". Did that, same reading. "gonna check the stuff on the distribution net some more, looks like a tough one to fix." "Don't you have to replace your seal?" "Naw. We'll be back in a few days to take another measurement, takes too long to seal it just to remove it again. we trust that you're not gonna steal power". Next day, one of them returns, takes another measurement, still too high. "I'm gonna have your local pole transformer re-tapped to reduce your line. I removed some caps off the net, but I can't take too many off, or else the other end of town will have too low voltage. We like to set the voltage at 120V at houses." He puts a new seal on the meter in the basement. My father said that he haden't seen the insides of the meter box since 40 years ago, when the house was built.

Guess I made the power company guys spend a few weeks work on this.
It's not over, yet. About a year ago, I smelled gas next to a mailbox on the streetcorner. Told the gas company, and saw them drilling holes in the ground throughout the neighborhood for weeks looking for the

leak.

I suppose all the neighbors are wondering why their light bulbs don't seem to last as long as they used to. :-

SPECIAL BULLETIN 17 ARLX017
FROM ARRL HEADQUARTERS
NEWINGTON CT DECEMBER 2, 1990
TO ALL RADIO AMATEURS

THE JOHNSON SPACE FLIGHT CENTER AMATEUR RADIO CLUB HAS RELEASED THE
FOLLOWING PRELIMINARY KEPLERIAN ELEMENT SET FOR STS-35/SAREX. THE
ELEMENT SET EPOCH TIME AND RAAN HAVE BEEN MODIFIED BY N5BF FOR THE
SUCCESSFUL COLUMBIA LIFT-OFF TIME 0649 UTC ON DECEMBER 2. SINCE
LIFT-OFF WAS 21 MINUTES AFTER THE SCHEDULED TIME, MOST EVENTS DURING
THE MISSION WILL PROBABLY OCCUR 21 MINUTES LATE.

SATELLITE, STS-35
CATALOG NUMBER, TBD
EPOCH TIME, 90336.3361111
ELEMENT SET, JSC-0006-A
INCLINATION, 28.4690 DEG
RA OF NODE, 4.5587 DEG
ECCENTRICITY, 0.0005720
ARG OF PERIGEE, 246.6067 DEG
MEAN ANOMALY, 119.6564 DEG

How about this for a "ham hell": put Herbie and Co. in large, steel-frame
apartment building, where every other resident has TV sets with indoor
antennas. Restrict them to 160 meters QRP only. And put them in a 10X10
room on the second floor. Of course, no antennas are allowed outdoors.
Oh yes, and every apartment has a dimmer switch.

Brad, and for any one else out there who would like to know.
You may call the FCC at their information line :(717)337-1212
nd ask them for the most recently issued callisgns for your call call district
for each of the 4 classes (Novice is class D) well, except for the 4 and 6 districts which only have 3 classes remaining (all the class A calls used up);
Boy my editing stinks.

Because they're young and haven't yet learned that no matter what you do
to the net, disorder increases. There is no way to reverse entropy.

But let them try. It won't hurt for long. Won't help either.

h yes, I forgot to mention. The FCC only tabulates the data on the first of every month. Usually they have the info available around the 5th of the month.
Remember, they process applications (or at least release them) on a weekly or semi-weekly basis (depending on class of liscence) and each of those batches are assigned callsigns in alphabetical order by last name. So guestimation example: KJ2AAA at the end of October - KJ2ADZ at the end of November. Now November 1990 had (your a Novice, right?) four TUESDAYS in it. So we will assume (big assume) that the calls were assigned in four equal batches of 26. Lets pretend that your test date was around October 15, meaning 5 weeks later (figuring it takes about 6 weeks to get a liscence around x-mas, though any number from 2 to 7 weeks is feasable for our 'FCC process date guess')
This says that Brian's 610 was processed by our example FCC on Nov 20 (just in time for the FCC employees to go home for Thanksgiving!)
putting him in the KJ2ACA-KJ2ACZ group. Brians last name is Andersen so we could guess that he will be first or second (or even third) yielding a call of KJ2ACA,B, or C. Of course much of this is VERY guess related and being honest with the net here, I have had little luck forcasting Novice callisgns (especially since many Novices are tested outside of the VE system)
now advanced calls I can get within 2 or 3 letters (well 75% of the time - 9/ out of 12) The extras have the problem of hams waiting around for "the call" to sail along and then sending a 610 direct to Gettysburg (3-4 wekk turnaround) for just a callsign change. Then there are all the different VEC (mostly areas outside of my neck of the woods 1 and 2-land) which have all sorts of different timing schemes that I have little knowledge of....
If anybody would like more info, e-mail me and I'll send you some more detailed info on timeing your callsign. But then again, I'm sticking with the call they gave me before I had a choice!

Ignorance. Count the number of exclamation points at the end of the
poster's sentence you quoted. Anyone who puts more than one
exclamation point at the end of a sentence isn't worth bothering
about.

3700. MAJOR SOLAR FLARE ALERT

Newsgroup: rec.ham-radio
Date: 1990-12-05 08:28:23 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901205012823.22601327@HG.ULeth.CA>
Source record: 5999

```
-- MAJOR SOLAR FLARE ALERT --

DECEMBER 04, 1990

Potential Impact Forecast
Flare Event Summary

--------

MAJOR ENERGETIC EVENT SUMMARY

Region 6397 (N09E45) has been throwing some unexpected surprises at us
lately. It has been abnormally active considering the relatively weak
magnetic gradients which have been observed in the region. At 02:03 UT on
04 December, Region 6397 spawned an M6.6/1F major flare at a solar position
of N08E56. This event was accompanied by a 310 s.f.u. Tenflare. There were
no significant radio bursts or shock-related frequency sweeps observed from
this event. The flare duration was a respectable 39 minutes. This flare
produced a moderate intensity SID/SWF at 01:57 UT on 04 December, which ended
at approximately 02:36 UT. Frequencies up to about 17 MHz were noticably
absorbed during this period over sunlit portions of the earth. This flare was
associated with minor VHF enhancements.

Considering the lack of complexity in this group, it is almost surprising
it managed to spawn such an energetic x-ray flare. The region is more active
than it apparently should be, by observing the data which has been collected
on the region thus far. It has not grown significantly over the past
24 hours, nor has its magnetic gradients changed much. It is therefore,
difficult to predict what this region may do next.

Aside from the major M6.6/1F Tenflare which occurred early on the 4th,
Region 6397 also managed to produce a class M1.8/1B flare at 14:39 UT on
04 December. This flare, located at N08E51, lasted for 38 minutes and was not
accompanied by any significant radio emissions.

If Region 6397 continues to behave as it has over the past several days,
it could conceivably erupt with another major flare. The Space Environment
Services Center expects this region to continue to produce M-class flare
activity with a slight risk of another major flare over the next 3 to 5 days,
depending on whether it detensifies or not.

Flare probabilities for the next 72 hours (ending 07 December) follow:

Flare Probability
Type 24hr 48hr 72hr
-------------- ---- ---- ----
Class M Flare 60% 60% 60%
```

Class X Flare 20% 20% 20%
Proton Flare 05% 05% 10%

Flare activity will likely remain elevated for the remainder of this week due to Region 6397's level of activity. The return of old Region 6368 on 11 or 12 December may increase the risk for M-class flaring even further. By that time, Region 6397 will be approximately half-way to the western limb. However, it is distinctly possible that Region 6368 has stabilized now (or even died on the far side of the sun). We won't know until 11 or 12 December.

POTENTIAL TERRESTRIAL IMPACT FORECAST

The major flare of 04 December is not expected to have a terrestrial impact. Its lack of association with shock-related frequency sweeps and small-size (in addition to the rather poor trajectory for any mass ejections) seem to indicate that the risk for a terrestrial impact from this event is small. It will, however, require close monitoring as it nears the solar meridian. If it grows or increases in magnetic complexity, the risk for PCA and proton activity will increase, particularly as it crosses over to the western solar hemisphere (which it will do in about 4 days - by 08 December).

There is a strong risk for potentially frequent SID and SWF activity over the next 3 to 5 days (at least). M-class flare activity should provide approximately 1 to 2 potential SID/SWF-capable flares per day. SID durations could exceed 50 minutes. SWF affected frequencies could exceed 15 MHz on the sunlit hemisphere of the earth. There is likewise, a moderate probability for associated VHF enhancements from some of the minor and/or potential major flare activity over the next several days at least.

Geomagnetic activity is not expected to increase as a result of the recent major flare. However, a well positioned coronal hole will likely begin affecting geomagnetic and auroral activity over the next 2 to 3 days (05 to 07 December). Radio propagation conditions may deteriorate over middle and high latitudes during this period. Low latitudes are not expected to be seriously affected. Effects from this coronal hole should diminish by 07 or 08 December.

** End of Report **

The idea behind this is to move the ham radio groups into the same hierarchy as the other radio groups. The hierarchy rec.radio was created a couple of years ago to hold rec.radio.shortwave, and has acquired other radio-related groups since then; it's the logical place for ham radio, too.

(Side note: Please make sure that discussion is posted to news.groups as well as rec.ham-radio. This is required by the Guidelines for Newsgroup Creation.)

Newton certainly killed the 2-body gravitational problem, but many
aspects of the many-body problem were better understood 200 years
after his death than at his death. In particular, while it took
more than 200 years to come up with the modern theory of stability,
200 years of perturbation theory revealed enough to make it plausible that
the solar system could be stable for billions of years
without invoking the hand of God to fix things up.

3705. Help - Philips video camera

Newsgroup: rec.ham-radio
Date: 1990-12-05 15:20:28 UTC
From: agodwin@acorn.co.uk
Message-ID: <4305@acorn.co.uk>
Source record: 6019
Cross-posted to: sci.electronics,rec.ham-radio

I've acquired a Philips monochrome video camera from a junk sale,
and am looking for details on connections to it. The usual suppliers
of service sheets have never heard of it - have you ?

The camera is marked '8925 002 50401' and is tube-based (Vidicon ?).
Connection is via a captive lead with a 7-pin DIN plug. The cable
contains 2 screened leads and 4 other leads. There is a 5-pin DIN socket
mounted near the lens (perhaps for auto iris control ?). The camera is
about 6 inches long, and the circuitry is protected by an anodised
aluminium cover. There's an orange lamp on top.
I'd guess from it's size and lens quality that it was intended for use
as a cheap security camera.

I can get composite video out of it by supplying it with 9V dc. I chose
this value because it results in about 6.3 V on the tube heaters - seemed
like a good idea at the time... This supply also results in voltages on the
tube neck between -50 and 300V, from an internal inverter.

The picture is reasonable, but suffers badly from after-images. I don't
know much about camera tubes, but it may be that it's being driven
incorrectly (wrong voltages) or perhaps it's just the way these devices
are.

I'm looking for more precise information about the power supply than my
guesswork, and confirmation that the tube is being driven at the right
sort of level. I'd also like to know about the signals I'm not using
on the interface cable - two of them appear to be sync inputs (if I
provide them with about 4V of sync, the internal sync generators will
lock onto it) but that still leaves 2 pins unaccounted for. One appears
to be an input, and the other an output.

Any ideas ? Or lectures on the care and feeding of camera tubes ?

>Mike KC1RP

Sorry to disappoint you Mike, but the 'dumb mode' you speak of is
actually 'KISS' (for Keep It Simple Stupid) protocol. This is a very
precise and extensive protocol all of it's own. There was someone on the
net that put a complete description of the KISS protocol, either here or
on rec.ham.packet - I'm not sure which. The problem is that the port on
your computer is async, with start and stop bits, and the signal on the
analog side of the modem is synchronous NRZI SDLC. Plus the function of
going push-to-talk and deciding when to transmit (Clear channel) I
beleive is all done in the TNC. So although it's supposed to be Simple
it really is not 'dumb' I guess. In other words you need a TNC or some
kind of KISS protocol emulator.

The notion of mv'ing rec.ham-radio to rec.radio.* is an excellent
one which I fully support.

The new heirarchy should be rec.radio.AMATEUR though not rec.radio.HAM
because the jargon term "Ham-Radio" is not common outside North America
and large portions of the net are now outside North America (unlike
when the current group was created). By using the normal, non-US-jargon
terminology the namespace is clearer and easier for folks to use. It
is also easier for folks potentially interested in becoming licensed
Amateur Radio Operators find the right newsgroup.

I'd also advocate mv'ing the parent group into a .misc group
(or equivalent) to reduce cross-posting and make the namespace simpler
(hence easier to use). I know that Jay won't like this last idea
since he`s opposed the whole .misc concept in news.groups, but I still
see lots of hard evidence that the concept works in the general case
not just in comp.sys.*

Regards,

Ran
randall@Virginia.EDU

The WABASH VALLEY AMATEUR RADIO ASSOCIATION, INC., will be host to any and all hams who wish to work the William B. Gaskins Memorial Club Station, W9UUU, or any of the club members who are operating their own station and announcing that their station is participating in the special event.

The special event will be from 1300Z Saturday, December 8, 1990, until 0300Z Sunday, December 9. (That's this Saturday from 8 am until 10 pm EST.) See the December, 1990, QST.

All bands (except 30, 17, and 12 m) and all modes will be used, depending on the members' preference. W9UUU, the club station, located in Terre Haute, Indiana, will be on the air for the special event on various frequencies that conform to band usage, propogation conditions, and operators' prejudices.

Stations wishing a certificate should send their QSL card and SASE to:

```
+------------------------------+
| (CALL OF THE STATION WORKED) |
| C/O Wabash Valley ARA, Inc. |
| P. O. Box 81 |
| Terre Haute, IN 47808 |
+------------------------------+
```

A certificate will be mailed as soon as possible.

```
*******************************************************
* *
* The special event is commemorating the founding of *
* the club station memorializing Bill Gaskins, *
* W9UUU. Bill was a charter member of the WVARA and *
* was an extremely active and helpful ham for many *
* years. *
* *
* It was Bill's dream that the VWARA could someday *
* have its own club station. After Bill's death, the *
* American Red Cross chapter in Terre Haute offered *
* the WVARA facilities for the club station. It was *
* at that time the club decided to name the station *
* in memory of Bill. *

Yeah, that's not that unusual. The voltage here in my house right now is 125v, and has been pretty much that for the last seven years. And my lightbulbs don't last real long either.

Our mountaintop repeater site had line voltage around 132 volts back in 1971; it's been dropping steadily since and is now down to about 118 - either the lines are aging or it's all the additional load as more equipment gets installed.

At work the voltage is a nice 117.5 on two of the three phases. It's about a volt higher on the third; I think there are fewer VAXes on that phase.

{>Then Mike Waters AA4MW/7 writes some junk and then . . . a number of other

{>rigs [do the same thing] and you might find a cheaper one if that is the
{>only thing you really are after.
{
{Well not quite
{ Most other rigs dont allow the remote controll including QSY that
{the Alinco does.

True, but I believe that there are a few that do and without some of the mobiling features of the Alinco they SHOULD be cheaper. I haven't looked though so I can't give models etc.

{Mike then writes:
{> couple of . . . problems . . .: (1) to enable cross-band repeat you must
{>cut a wire that inhibits out of band operation. BOTH TX and RX! THat could
{>be a real problem with remote operation.
{
{This is completely incorrect. When you cut the wire it ENABLES out of band
{operation.

Isn't that what I said? "the wire inhibits out of band operation"

{He then continues:
{>There is no easy way to "one way repeat" i.e. UHF to VHF only.
{
{This is incorrect. If the DTMF squelch is enabled on both 2m es 440 then
{the proper tone sequence is required to open the squelch and you can use
{your ht to RX and your remote base to TX.

Have you tried this? I don't have the DTMF squelch, but the manual (the new one) says that the DTMF squelch works for BOTH bands at the same time. It says nothing about the repeater mode however. I plan to use PL for this purpose.

Since both are $40+ option boards I don't classify either as "easy" however. Setting a control, cutting a wire I class as "easy".

{Furthermore as I posted last month, I have been working with Dexter and Greg
{at Alinco and have found a way to automatically control the offset.

It works, but it would still be nice to have a "readback" to know just what is "in there".

>Guy leaves, a few hours later, calls. "try measuring the voltage" "Still too
>high, 127V."

>We like to set the voltage at 120V at houses."

Yeah, but not too high by much...

The typical electric utility tariff (what the utility must provide under its contract with your state government) calls for 120v +/- 5% at your meter, or 114-126 volts. You can't really complain about 126 volts. Also, a 'good' digital (or analog) meter will not necessarily give an accurate reading, as most of them are average-responding, rms-reading, because if there are a lot of solid-state power controls on your feeder, the AC waveform can get fairly chopped up.

Rich

How does one shunt feed a steel tower? It has to be painted of course, so contact is not easy. One could scrape off the paint if you knew the exact spot needed for the tap, but I suspect that is subject to some experimentation, and you can't scrape the paint off everywhere. I have tried to do this by wrapping heavy aluminum foil around a painted tower leg, to achieve a capacitive coupling. The capacitance is fairly large, so the reactance is not too large. It is also easy to slide it up and down for adjustment. But it never worked anyway. How have others solved this problem?

I`am happy to anounce, that you now can get the best and most used
packet radio program, from iesd.auc.dk (130.225.48.4)
as anonymous ftp.

The program is placed at
/pub/ham-radio
And the name is
pcmb510.lzh

If you use it please E-mail, to me so that we can send you information
about neu things....or developments of this fine program..

There is also developt a remote contole program to Kenwood radio`s
but there is not English docomentation..... but it will come

Hallo Welcome to PCMBOX.

*** PCMBOX Copyright (c) 1990 OZ1HMN ***

What is PCMBOX ????

PCMBOX is a Packet terminal program with many features including mini mailbox,
21 commands based on the // principle.

PCMBOX is written in Turbo Pascal(tm) by OZ1HMN and is a shareware program
fully Copyrigthed by OZ1HMN. It is forbidden to sell and may not be used
to any commersial purposes.

Now some of the features:

Yapp is supported in terminal as well as in mailbox mode.

A log is updated every time you connect someone, and a seperate
log file for mailbox users.

You can call an External program within PCMBOX.

You can connect via the routing list (Alt-C).

Setup of your favorit editor.

Setup of your favorit viewer.

Create a mail file within PCMBOX.

RX buffer containing op to 400 lines.

Trace (look for) specific text received, and then beep.

And now a dump of the 3 help screens:

> Jay Maynard and I propose the following reorganization of the rec.ham-radio
> hierarchy:

I would respectfully suggest the slang term "ham" be replaced by the
proper designation "amateur". This slang term has caused more
problems for public relations and promotion of amateur radio around
the world than any other single thing (IMHO).

I propose the proposal be re-worded as follows (uppercase used for
emphasis):

1. rec.radio.AMATEUR

"A General newsgroup for discussions about amateur radio."
^^^^^^^
2. rec.radio.AMATEUR.legal

"A newsgroup for the discussion of legal aspects of amateur radio."
^^^^^^^
3. rec.radio.AMATEUR.packet

"A newsgroup for discussions about amateur packet radio."
^^^^^^^
4. rec.radio.AMATEUR.swap

"A forsale group for the rec.radio.amateur hierarchy."

Then what IS the basis for the 120V +/- 5% if not rms? Seems like the only
fairly repeatable reading would be peak to peak...

BTW, there is all sorts of interesting hash riding on the 60Hz sine wave.
Solid state power controls may be the least of the problem; inductive
loads can put a lot of crap on the waveform, too.

3727. More DR-590 Codes...

Newsgroup: rec.ham-radio
Date: 1990-12-05 21:38:51 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <1246@west.West.Sun.COM>
Source record: 6018

I was visiting the local HRO at lunchtime and happened to meet the visiting Alinco rep. He was showing off all of the remote features of the DR-590. Apparently he has been doing quite a bit of research to figure out the thing, including taking trips to Japan and interviewing the design engineers.

He said that almost all of the basic codes were in the manual but that the were very lightly covered. One pair of codes that were not mentioned were D99 (cross band repeat ON) and D01 (cross band repeat OFF).

Contrary to what others have said on this forum, I saw him change frequencies on both bands from the remote radio. He was going in on 2m and out on 440. He was able to set the 440 frequency as well as the 2 meter frequency by remote control. He indicated that only PL and repeater offset could not be set remotely, however he did acknowledge the trick of putting a shift in one of the ARM memories which he learned from a user. He said that even the engineers in Japan were unaware of this.

I asked him about documentation and he said that they were faxing it out to all the stores which carry it. Apparently one can call them as well (FAX: (213) 618-8758 or Voice: (213) 618-8616).

The comment was made that when the Japaneese brought the radio out to the U.S., they only mentioned in passing that the rig could be controlled remotely. Apparently, they never thought much about it themselves. They (the Japaneese) were surprised at how much commotion their American sales reps made about it.

In talking with the sales rep, it became apparent how all of this has transpired. It was pointed out that you could do anything from remote that you can do via the touch-tone pad on the microphone. I also asked him if this included the limitiations - it did. You also cannot select shift or PL directly from the microphone pad.

This leads me to speculate that what has happened here is that remote control of the radio was developed by "accident" as an outgrowth of the ability to control the rig from its microphone touch tone pad. It seems that when the dsq (dtmf decoder) was added that these features suddenly became available. This would explain why the radio has been called an "almost great" in that the remote-base functions are "nearly complete". Perhaps it was never designed to begin with.

I would further speculate that much will be learned by both Alinco and its competitors from this radio and that by next year a "complete" or fully functional remotable rig will be available.

I can't wait :-)

You are lucky. A friend of mine was the victim of a power company
mistake. They rewired his transformer and started feeding him 400V. They
paid for his microwave, refridgerator, clocks, and answering machine.

I expect to spend considerable time in France early next year. My daughter and I are both hams and would like to be able to communicate with each other on 2 meters while we are there. We have sent away to ARRL for info, but I thought I'd ask if anyone had more information.

Is there reciprocal operating with France (vs US)?

We don't speak ANY French - is that a problem?

Has anyone out there in net-land ever operated in France with a reciprocal license?

3732. Solar System Stability (was Re: * SpaceNews 03-Dec-90 *)

Newsgroup: rec.ham-radio
Date: 1990-12-05 23:33:38 UTC
From: loren@dweasel.llnl.gov
Message-ID: <87290@lll-winken.LLNL.GOV>
Source record: 5927
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,sci.space

Concerning solar system stability, it must be conceded that this is not a completely solved problem.

Perturbation theory techniques are the traditional way to evaluate this problem. However, use of them depends on dropping higher-order terms, and there is the problem of how much these contribute to the final results. In particular, if there is a near-commensurability in some of the orbit periods, then that will magnify the effect of whatever terms in which it causes a near-cancellation of the rate of change. Example: if there are two objects, 1 and 2, of which object 1 has a mean angular velocity twice that of object 2, then terms containing expressions like:

l1 - 2*l2

where l1 and l2 are the mean longitudes of the two objects, will change slowly and may even produce big oscillations in l1 and l2.

Since most perturbation-theory analyses ultimately involve averaging over orbit positions, resonance terms like the example mentioned above are a serious difficulty, unless they can be identified.

Even in that case, one may approach the limits of analytical tractability, and have to resort to numerical integration, which can be done directly on the coordinates of the objects. I note that orbit elements can be thought of as "coordinates" in this context, though their equations of motion are more complicated than the equations of motion for positions and velocities.

Direct integration of the positions and velocities also has the advantage of keeping all the terms, as it were, as opposed to doing integration for the orbit elements with a truncated perturbation series, due to the missing-term problem. However, integrating orbit elements can cover a much longer time range for a truncated perturbation series, because the orbit-variation timescale is usually much greater than the orbit periods.

Actual results? It appears that some of the objects in the Solar System move chaotically. Saturn's satellite Hyperion is known to tumble chaotically, for instance. And numerically integrating Pluto's orbit reveals it to change chaotically. There is even evidence for chaos in the motions of the four big planets -- Jupiter, Saturn, Uranus, and Neptune. However, the "size" of the region of chaos is still uncertain. If it turns out to be small, then the motions of the

planets are predictable within that region, and it may even be that
the Solar System is stable over timescales of billions of years
despite the weak chaos in the motions of the planets. More research on
this question will certainly be needed.

Hello, all -

Got a call last evening from Hank Hayes, one of the operators of Radio Free New York - a free radio station which broadcasts a 3-hour program each Saturday night at 11pm Eastern via the transmitter facilities of WWCR, 7520 kHz.

This Saturday night is the 10th anniversary of the death of John Lennon and the station is planning a special memorial broadcast. They have some super special things planned for this program, including clips of the first radio and tv announcements of the shooting. They plan to do some live broadcasting from the Dakota Apartments on Central Park West where Lennon lived with his family and plenty of other great stuff. The focus is intended to be upbeat and comprised of fond memories.

Don't miss it. For those of you who participate on Los Numeros, the broadcasting crew will be live on-line with us during their broadcast.

Time and place, once again - WWCR, 7520 kHz, 11pm Eastern, Saturday night local, 12/8 (0400 UTC Sunday 12/9).

/HM

Very good point. The gamma rods turn out to be real long too with the
160 meter one being 32 feet. The crankup poses some interesting mechanical
and electrical problems. Any solution that requires climbing the cranked
up tower is too dangerous to think about. Perhaps telescoping gamma rods
with finger stock at the join and spring loaded metal rollers at the
tower joins would work. They'd probably wind up being RFI generators though.

I had enough difficulty getting the University to enable the current groups, changing things just makes life difficult. We will probably lose the service altogether.
Mike.

I agree with Henry. Newton humbles us all. As for the following 370 years of
many-body perturbation and stability theory: bah! "plausible" and "could be"
are waffle-words. How can this billions of years stability stuff be science
if you can't test the result of the theory? Meet me in two billion years
for pizza. If it turned out that the solar system WAS stable, i'll buy you
a beer.

3745. Alinco control

Newsgroup: rec.ham-radio
Date: 1990-12-06 12:33:00 UTC
From: PERRYR@WABASH.BITNET
Message-ID: <9012061234.AA02681@ucsd.edu>
Source record: 5973

Someone asked about the memory control of Alinco rigs (with ref to remote control), and while I can't vouch for the 590, I have the DJ-160 HT. On that rig, the memory can be accessed by the rotary dial on top of the HT, and a pushbutton on the top of the front side. Both of those methods are just a increment-decrement. There is NO provision for accessing a memory channel directly.

All in all, I've been very happy with the rig, my first foray into the world of 2m. The only bad things I have to say about it are

1) The manual STINKS to high heaven. It's obviously a translation from Japanese, and it's more confusing than it is useful. It took me 3 weeks to figure out the DTMF/CTCSS functions.

2) Alinco has a good radio, but there are NO accessories available for the HT's. . . They shipped the rigs to get them on the market, but haven't supported them. A speaker/mike would be nice, as would DC adapters, etc...

Well, I've taken up enough bandwidth for today.
Just as a closing comment, does anyone have MARS/CAP mods for the DJ-160? I would be very interested in them.

Yours,

R. Todd Perry

OK, is there support for this one? If so, I'll be happy to add it to the plan.
There has been occasional CB-related discussion in rec.ham-radio, and it has
proven to be a remarkable flame generator...

Jim, that is unmitigated crap. Are you suggesting that, since the cops
can't stop every crime, they shouldn't mind the legalization of any
technology that makes committing a crime easier? That's exactly what
I'm talking about, and it has nothing to do with "sharks" and "guppies."

> Are we to infer from your constant references to the fact that you
> participate in the ARRL program to educate the FCC on what's happening in the
> real world that the League approves of this FCC "Whack the Guppies" policy?

Attacking the messenger because you dislike the message adds nothing
useful to this discussion. Also, as you very well know, my postings
here do not represent official League policy. If people insist on taking
anything any ARRL staffer or official says as "League policy," how
can there be any dialogue between the officials/staff and the members?

In article <1246@west.West.Sun.COM> flloyd@L1-A.West.Sun.COM (Fred Lloyd SUN Phoenix SE 602-275-4242) writes:
{
{He said that almost all of the basic codes were in the manual but that
{the were very lightly covered. One pair of codes that were not
{mentioned were D99 (cross band repeat ON) and D01 (cross band repeat OFF).

{Contrary to what others have said on this forum, I saw him change
{frequencies on both bands from the remote radio. He was going in on 2m
{and out on 440. He was able to set the 440 frequency as well as the 2
{meter frequency by remote control. He indicated that only PL and
{repeater offset could not be set remotely, however he did acknowledge
{the trick of putting a shift in one of the ARM memories which he
{learned from a user. He said that even the engineers in Japan were
{unaware of this.

Sounds like "hacking" of the three digit codes from A00 through D99 might just be worthwhile here! THe ones I posted were the only ones in the new (printed) manual. If indeed you can do any of the functions that you can remote from the mic. then indeed it IS a powerful feature.

As for offsets and PL tones, personally I like to put the whole lot in a memory and just select it that way. I only use a couple of repeaters with PL tones anyway!

{I asked him about documentation and he said that they were faxing it
{out to all the stores which carry it. Apparently one can call them
{as well (FAX: (213) 618-8758 or Voice: (213) 618-8616).

I will give them a call an ask! Thanks!

{The comment was made that when the Japaneese brought the radio out to
{the U.S., they only mentioned in passing that the rig could be
{controlled remotely. Apparently, they never thought much about it
{themselves. They (the Japaneese) were surprised at how much commotion
{their American sales reps made about it.
{
{This leads me to speculate that what has happened here is that remote
{control of the radio was developed by "accident" as an outgrowth of the
{ability to control the rig from its microphone touch tone pad. It
{seems that when the dsq (dtmf decoder) was added that these features
{suddenly became available. This would explain why the radio has been
{called an "almost great" in that the remote-base functions are "nearly
{complete". Perhaps it was never designed to begin with.
{
{I would further speculate that much will be learned by both Alinco and

{its competitors from this radio and that by next year a "complete" or
{fully functional remotable rig will be available.

Certainly makes as much sense as any other explanation that I have heard. For the most part, the rest of the rig is SO well done that it really is jarring to see something like this that is simply not done.

It is clear that the translated manual is at least part of the problem and that they must have had trouble getting a good translation. THe manual I got with my rig was Xeroxed and had all kinds of stuff on odd pages - as if someone was still doing a "paste up". THey sent me a printed one free and it is MUCH better, but it looks like there are still a few things missing in it.

{I can't wait :-)

Me either!

{-fred (still stuck with my 721), AA7BQ

Sounds good to me on 2M at least :-) Mine is down right now because of an alternator problem in the car, but hopefully I'll see you on 2 again.

3750. DX Map: Hypercard stack

Newsgroup: rec.ham-radio
Date: 1990-12-06 15:11:39 UTC
From: saaf@joker.optics.rochester.edu
Message-ID: <SAAF.90Dec6101139@joker.optics.rochester.edu>
Source record: 5886

I just finished the stack I mentioned here a couple of weeks ago. It is available via anonymous ftp at joker.optics.rochester.edu (128.151.240.1). I have also mailed copies to those who requested it last week. If someone who has no ftp capability wants a copy, I will be glad to mail it to them. Below is some information about the stack.

DX Map 1.0 by Len Saaf, NV2Z
A Hypercard stack for the Apple Macintosh.

The stack is freeware. It may be distributed in part or in whole provided that it is distributed for free.

The stack requires Hypercard 2.0.

DX Map features:

* Your QTH is marked on the map and your local time appears above it

* UTC is displayed at the bottom of the map

* A DXCC country can by selected by either choosing the country name from a list or by entering a callsign or prefix. The DXCC country is marked on the map and the following information is listed:

* Country name
* Continent
* CQ zone(s)
* ITU zone(s)
* Distance from your QTH in miles and kilometers
* Bearing in degrees from your QTH
* Callsign allocation
* The local time in the DXCC country is displayed above its location on the map

* Your location and a remote location are fully configurable

I wrote 3 XFCNs for this stack:

* "CallToNum" takes a callsign and returns the number of DXCC countries that could have that callsign followed by ID numbers for each of those DXCC countries.

* "NumToInfo" takes one of those ID numbers and retrns a bunch of info for that DXCC country. The info is from a list I got off rec.ham-radio.

* "coords" takes 2 lattitude/longitude pairs and returns the distance between them and the bearing from the first to the second.

The source code to these 3 XFCNs is free for the asking. They are written in Pascal.

All bug reports, comments and/or suggestions are welcome.

73,
Len

This makes sense... BUT if we are going to go through the pain of changing
the name of this group, we SHOULD make an effort to refer to ourselves in a
way that a casual 'reader' (the supposed 'lay' reader, or non-amateur) would
understand who we are.....

Basically, what I am saying is that all references to the slang 'HAM'
should be changed to 'AMATEUR'.... therefore 'rec.radio.ham' becomes
'rec.radio.amateur' and so on. This will not cause confusion on anyones part.
I think that only 'hams' know what the term 'ham' radio really means.

PLEASE, if we are going to change names of the group, lets go for the
full name:

rec.radio.amateur
rec.radio.amateur.packet
rec.radio.amateur.swap
rec.radio.amateur.legal (yes, I think this subgroup can be added,
although I wonder how many people will 'read'
it at all!)

P.S. It seems that this site only receives a VERY FEW postings for rec.ham-radio. So if I seem to not know what is going on... it's because I don't!!!

3752. Suitability of Drake R-7 receiver for shortwave listening

Newsgroup: rec.ham-radio
Date: 1990-12-06 15:18:03 UTC
From: parnass@cbnewse.att.com
Message-ID: <1990Dec6.151803.9029@cbnewse.att.com>
Source record: 5891
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Richard Crisp asked me about the Drake R-7 receiver and I thought there may be others interested in this model.

I had a couple of Drake R-7 receivers, an Icom R-70 and R-71A (w/passband tuning), and an JRC NRD-525 (and TR-7A and TR-7s along the way, too :-]).

The R-7 is an excellent receiver and was tops in its day. It has more and better filters and passband tuning than the R-71A, R-5000, and NRD-525. It also has a low internal noise level because it was not fully synthesized. The R-7 is easier to modify and repair than the NRD-525, which uses surface mount technology.

The R-7's synchro-phase AM detector was great for listening to foreign broadcasts in a crowded band as you could use a reduced bandwith and listen to one sideband without sacrificing fidelity.

For utility monitoring, the R-7 has some drawbacks.

1. The R-7, R-7A, TR-7, and TR-7A employed permeably tuned oscillators (PTO) in which a core was moved in and out a coil. They drifted, even after 30 minutes warmup. I measured the drift on my Drake equipment over a 4 hour period but don't have the data handy. The drift is slow but would prove annoying to RTTY/FDM monitors.
2. The Drake 7 line had no memories or scanning. These features are very, very useful to CW/SSB utility monitors.
3. The 7 line had no squelch, something an SSB/CW ute monitor would miss.
4. The R-7 lacks an FM detector which more modern receivers have. I've listened on VLF FM to carrier current intercoms, and used HF FM receivers with converters.

The R-7 is a classic receiver, still excellent for digging weak signals out of a pileup, but not as flexible as more modern gear.

>>of solid-state power controls on your feeder, the AC waveform can get fairly
>>chopped up.
>
>Then what IS the basis for the 120V +/- 5% if not rms? Seems like the only
>fairly repeatable reading would be peak to peak...

You apparently mis-read the note -- it _is_ RMS, but very few meters really
measure it. They respond to the average value of the waveform and are
calibrated in RMS equivalent of a distortionless sinewave. You have to get
one that is RMS responding -- those are specially marked RMS (and many are
mismarked as 'true' RMS, as if there were any other kind). Digital meters
are always mismarked as to the correct number of digits, but that's another
story.

RCA used to make an expanded-scale (100-140 volts) ironvane repulsion Line
Monitor (TM?) having nice ballistics to show line fluctuations.

>BTW, there is all sorts of interesting hash riding on the 60Hz sine wave.
>Solid state power controls may be the least of the problem; inductive
>loads can put a lot of crap on the waveform, too.
>
>-- Jerry Callen
> jcallen@encore.com

Only when the loads vary, otherwise they just affect phase relationships.
The power company doesn't like residential phase controls because it results
in poor phase relationships that it doesn't normally meter and bill for.
They would be worried if the phase controlled loads became a significant
portion of the total demand.

> I agree; how about calling it "rules" rather than "legal" ?

I completely agree with this proposal to change the proposed name to
...rules. I have been very uneasy about the ...legal name, believing that
it would *not* be intuitively obvious what *should* be in the new
group. I felt the result would be that people would cross-post
to several rec.ham-radio groups, thus increasing the noise level.
With rec.ham-radio.rules (or rec.radio.amateur.rules) we might
save some bandwidth (and sanity).

FILED NOV 13 PM 4:39
CLERK U.S. DISTRICT COURT
NORTHERN OHIO DISTRICT
CLEVELAND

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF OHIO
EASTERN DIVISION

JAMES D. MACMILLAN,) 1:87 CV 2820
)
Plaintiff,)
)
vs -) ORDER
)
CITY OF ROCKY RIVER, et al.,) -----
)
Defendants.)

Battisti, J.

On September 21, 1990, an order was issued addressing
the parties cross motions for summary judgment in the instant
case. The court ruled that the Rocky River municipal
ordinances in question were facially valid, but as applied
were preempted by PRB-1, an FCC regulation. In so ruling, the
court declined to reach the constitutional issues raised by
the Plaintiff, James D. MacMillan. Plaintiff was left to seek
his amateur radio antenna permit under the codified Rocky
River procedures, and Defendants were instructed that future
decision making in this area must include "a reasonable

accommodation of the federal government's interest in amateur communications," as expressed in PRB-1.

With the issue of the ordinances' validity addressed, all that remained for consideration was the plaintiff's request for damages. Accordingly, the parties were requested to brief
1

any remaining claims for damages. (1)

Since Plaintiff's subsequent brief raised only the issue of attorneys fees under 42 U.S.C. sec. 1988, the court assumes that this is the only issue remaining for disposition.

Section 1988 states, in pertinent part:

In any section or proceeding to enforce a provision of sections 1981, 1982, 1983, 1985, and 1986 of this title, title IX of Public Law 92-318, or title VI of the Civil Rights Act of 1964, the court, in its discretion, may allow the prevailing party, other than the United States, a reasonable attorney's fee as part of the costs.

The Plaintiff claims that although the court did not rule on any of his constitutional claims, he is entitled to attorney's fees as discussed in Maher V. Gagne, 448 U.S. 122, 130-32 (1980).

Although Maher explores the intended scope of sec. 1988, Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447 (6th Cir.1986), cert. denied 479 U.S. 884 (1987), is more relevant to the present inquiry. Seaway Drive-In explains the Sixth Circuit's application of Maher, as well as, the Supreme Court's later holdings in Smith v. Robinson, 468 U.S. 992 (1984), and Hensley v. Eckerhart, 461 U.S. 424 (1983).

In Seaway Drive-In, the Plaintiff challenged a town ordinance that regulated drive-ins. 791 F.2d at 449. A preliminary injunction and eventual consent decree were based upon state law claims, obviating the need for the district

---

(1) The court has held that the Defendants were entitled to qualified immunity with regard to the claims against them in their individual capacity.
2

court to consider the plaintiff's constitutional challenges Id. The district court declined to award the sec. 1988 attorney's fees and the court of appeals reversed. Id. at 455. Seaway Drive-In is analogous to the instant case in which the court did not reach the Plaintiff's constitutional challenges due

to the presence of a dispositive non-fee claim.

The Seaway Drive-In court began its analysis by citing the following passage from Maher.

The legislative history [of sec. 1988] makes it clear that Congress intended fees to be awarded where a pendant constitutional claim is involved, even if the statutory claim on which the plaintiff prevailed is one for which fees cannot be awarded under the act. The report of the Committee on the Judiciary of the House of Representatives accompanying H.R. 15460, a bill substantially identical to the Senate bill that was finally enacted, stated:

To the extent a plaintiff joins a claim under one of the statutes enumerated in H.R. 15460 with a claim that does not allow attorney fees, that plaintiff, if it prevails on the non-fee claim, is entitled to a determination on the other claim for the purpose of awarding fees.

Morales v. Haines,486 F.2d 880 (7th Cir. 1973). In some instances, however,the claim with fees may involve a constitutional question which the courts are reluctant to resolve if the non-constitutional claim is dispositive.

Hagens v. Lavine, 415 U.S. 528 [94 S.Ct. 1372, 39 L.Ed.2d] (1974). In such cases, if the claim for which fees may be awarded meets the 'substantiality' test, see Hagans v. Lavine, supra; United Mine Workers v Gibbs, 383 U.S. 715 [86 S.Ct. 1130, 16 L.Ed.2d 218] (1966), attorney's fees may be allowed even though the court declines to enter judgment for the plaintiff on that claim, so long as the plaintiff prevails on the non-fee claim arising out of a 'common nucleus of operative fact.' United Mine Workers v. Gibbs, supra, at 725 [86 S.Ct. at 1138]. H.R.Rep. No. 94-1558, p. 4, n. 7 (1976).
3

448 U.S. at 132, n. 15 (cited at 791 F.2d at 451). The court equated the test laid out in the legislative history -- i.e. the requirements that the fee claim be substantial and that the fee and non-fee claims arise out of a common nucleus of operative -- with that used to determine whether a court has pendent jurisdiction over state law claims. Seaway Drive-In, 791 F.2d at 452. In addition, it

held that the district court had erred in basing its substantiality determination on whether the fee claims could survive a motion for summary judgment at the time of the consent decree. Id. Under the proper substantiality test, a claim is only "insubstantial if it is `obviously without merit' or if `its unsoundness so clearly results from the previous decisions of [the Supreme Court] as to foreclose the subject and leave no room for the inference that the question sought to be raised can be the subject of controversy, '" Id. (Citing Hagans, 415 U.S. at 537).(2)

Based upon the sixth Circuit's construction of the Maher test, this court finds that Plaintiff's constitutional claims were both substantial and arising out of a nucleus of

---

(2) Further the court stated that " [t]he claim must be `so insubstantial, implausible, foreclosed by prior decisions of [the Supreme Court] or otherwise completely devoid of merit as not to involve a federal controversy within the jurisdiction of the District Court, whatever may be the ultimate resolution of the federal issues on the merits.' " Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447, 452 (6th Cir. 1986), cert. denied 479 U.S. 884 (1987), (citing Hagans v. Lavine, 415 U.S. 528, 543 (1974)).

operative fact common to both the fee and non-fee claims.(3) Finally, the Defendants make the unfounded claim that the plaintiff is not a prevailing party. The plaintiff is considered to have prevailed if there is "some actual benefit to the plaintiff either in terms of monetary damages, injunctive relief or a voluntary change in defendant's conduct. " Wooldridge v Marlene Industries Corp., 898 F.2d 1169, 1174 (6th Cir. 1990).
Plaintiff's claims all involved a challenge to the review process to which he was subjected. The court determined that the process was flawed, but only reached

---

(3) The Defendants raise Smith v. Robinson, 468 U.S. 992 (1984), as a basis for denying attorney's fees. The Sixth Circuit addressed both Smith and Hensley v. Eckerhart, 461 U.S. 424 (1983), in Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447, 453-55 (6th Cir. 1986), cert. denied 479 U.S. 884 (1987).

Smith involved plaintiff seeking district court review of an adverse agency ruling on numerous non-fee grounds. The only fee claim was a due process attack on the administrative proceedings themselves. The due process claim sought only to prevent further state hearings under the challenged

regulation. The Court's holding, therefore, that a fee award was inappropriate was based on the fact that "the due process claim and the substantive claim on which plaintiffs ultimately prevailed involved entirely separate legal theories and, more important, would have warranted entirely different relief. " Smith, 468 U.S. at 1015.
The Sixth circuit viewed Hensley as reaching a similar holding. "Hensley makes clear that the purpose of the 'relationship between the claims' element or the fees award test is to prevent the award of fees in those cases where the fees and non-fee claims ar aimed at achieving different results or where they are based on different facts and different legal theories." Seaway Drive-In, 791 F.2d at 455. Neither of these cases is analogous to the instant case. The constitutional claims in this case arose from the same local review process. In addition, the relief available in each was substantially similar.
5

Plaintiff'spreemption claim. plaintiff has, therefore, succeeded in obtaining a new hearing in which the federal interest in amateur radio operation is to be seriously considered. This should lead to a hearing process which is substantially different from plaintiff's last hearing. Defendants make the alarming allegation that the new review "is consistent with and is not a material alteration of previous consideration of PRB-l by ROCKY RIVER. " This statement is followed by a Citations to the transcript of the prior review which indicates that PRB-l and technical data were submitted for consideration. The Defendants ought not to think that they will comply with this court's order by merely going through the motions or denying Mr. MacMillan another permit. Any decision to disregard the federal interest raised in PRB-l must be based upon substantial justification end explained in the record. Defendants should keep in mind that after this litigation it may be more difficult to support a claim for qualified immunity if they once again fail to sufficiently consider the federal interests involved.

Plaintiff's motion for sec. 1988 attorney's fees is GRANTED. Plaintiff is instructed to submit a reasonable accounting of his fees in this case within thirty days of the issuance of
6
this order.

IT IS SO ORDERED.

Frank J. Battisti.

3757. FCC's No-Code Proposal: Where's it headed?

Newsgroup: rec.ham-radio
Date: 1990-12-06 17:12:17 UTC
From: 0003829147@mcimail.com
Message-ID: <1990Dec6.171217.29904@news.nd.edu>
Source record: 5959

As someone who is just beginning to study the appropriate rules and code
(in contemplation of a Novice license), I wonder if anyone has an idea
what's the current status of the FCC's Communicator License proposal.
Is it still in the review stage? And if it's already been approved,
when does it take effect?

Thanks in advance for your reply.

>Mike.

Ignoring the fact that local administrative problems aren't of relevance to the net at large, there probably are a fair number of folks who'd like to read the Amateur Radio groups as mail rather than news.

Perhaps someone out there would be willing to setup a news->mail gateway for one or more of these groups. There is a very slight chance I could work out something like that, but it isn't trivial for me in my present circumstance. Surely there is an Amateur Radio operator who is a sysadmin somewhere already who could be talked into creating such a service. I'd be happy to help out with the "How to set it up under UNIX ?" if someone were willing to put it in place.

>for pizza. If it turned out that the solar system WAS stable, i'll buy you
>a beer.

Seen in Usenet newsgroup sci.space.celmech.history, 6 Dec 2000001990:

The adjudicating committee appointed last year has regretfully
announced that the Two Billion Year Bet has had to be called off.
The pizza was good, but everyone had to buy their own beers.
(The management did, however, agree to a special rate, only
$6945/liter for an excellent import from Heidelberg IV. The
local branches of the major US brewers offered to provide beer
free, but everyone naturally ignored them.) Citing impossible
difficulties in deciding whether the solar system would have
been stable if left alone, the committee concluded that no
settlement of the bet was possible. "Moving Venus and Mercury
out was not that big a deal, and we think we could have allowed
for that, but the Arts Council grant of 3476876 for rearranging
the asteroids into aesthetically pleasing formations by modulating
the orbit of Jupiter just caused hopeless confusion, and when the
Flat Ecliptic Society started tidying the orbits up in preparation
for the Galactic Fair of 78654379, well, that was the last straw.
Not even the generous donation of five milliseconds of Cray-94673
time by UUNET Intergalactic Communications Inc was sufficient to
decide what would have happened if the upkeep of the solar system
had been neglected for so long."

>real-time voice connections, where end-to-end delays of much more than a
>few milliseconds are intolerable (in full-duplex, anyway).

We experience end-to-end delays of up to 250 milliseconds in full-duplex OSCAR 13 SSB, and it's quite tolerable. While most contacts are still conducted half-duplex style, many ops casually converse in full-duplex very successfully. Not that the lack of delay wouldn't be desirable, but for the record, a big delay is being tolerated today.

By the way, on the subject of delayed full-duplex, pileups on OSCAR 13 are unique, since everyone can hear how well they are heard in the downlink. We can get into a mode where everyone collides, then there's a bit of a lull, so everyone tries again. Retrying after a random time is often more successful. Sort of like a real ETHERnet.

How about rec.radio.amateur.policy?

My only objection to the new newsgroup is that it has all the earmarks of sticking one's head in the sand rather than coming to grips with the fact that when ham radio dies (and it probably will) it will be for political reasons. We ignore that side of the hobby at our peril.

The technoids go on and on wonderfully about their ideas for the design of the Phantasmagorical Data Engine with the blind faith assumption that when they're done, we'll have amateur bands to use it in. I don't think we can assume that, and sticking those who write about it in a "newsghetto" so they can be ignored more easily will be counterproductive in the long run. Penny wise and pound foolish, as it were.

> I think that only 'hams' know what the term 'ham' radio really means.

Sounds like a good idea to me. We could use more members, and I think
"amateur" is more recognizable to non-hams.

> rec.radio.amateur
> rec.radio.amateur.packet
> rec.radio.amateur.swap
> rec.radio.amateur.legal (yes, I think this subgroup can be added,
> although I wonder how many people will 'read'
> it at all!)

r.r.a.legal seems a bit too specific. Legal debates (e.g. regulation
debates, tower ordinances, etc.) seem to come and go in spurts. I
don't see the use of having a seperate group for just this particular
aspect of normal traffic.

r.r.a.swap might be better as just rec.radio.swap, since this may encourage
others with non-amateur-specific yet amateur-related equipment to post
here as well. For example, test equipment, SW receivers, scanners,
microwave equipment, etc. is of interest to hams, but is not necessarily
ham specific. Traffic on the current r.h-r.swap is relatively light
the way it is now (probably averages about 8 articles/day), so expanding
it seems to be logical.

Another idea, though I don't feel too strongly one way or the other
on this one. Make it rec.radio.amateur.digital instead of .packet.
This may encourage discussion of possible new modes other than
what we commonly consider "packet" (e.g. spread-spectrum). Oops.
I can see it now. Some of the die-hard CW ops will decide that
this is their place to hang out. :-)

I would like to know if anyone has used one of the commercially available FAX machines over an amateur radio link? I think the signals represent bitmap images (0 bit for a white pixel, 1 bit for a black pixel) sent as a bit stream at a 9600 baud data rate.

If this has been done, how did you do it? How did you interface the FAX to the radio? I presume that the UHF bands were used owing to the bandwith needed.

Any information would be appreciated. I'll summarize and repost if enough interst exists.

I would look first for some equipment/appliance that includes 1 or
more semiconductor rectifying junctions. Garage door openers are
notorious because they have long wires attached which make great
antennas. Also electronic doorbells for the same reason. One
situation I read about involved a kid's crystal radio.

You had a very nice signal in NNJ. It's amazing what you can do
with such a short antenna. How do you match that thing? The
feed point impedance must be very low.

>. We know that we were beaten this
>year by K2WI, who posted 902 QSOs and around 94 multiplier.
>
>Are there any other scores out there? If so, we'd like to hear about
>them!

I heard from W2GD that AB4RU, who was also multi-op, had a higher
score than K2WI. They were using a 1/4 wave tower with radials
elevated about 30' off ground.

Best score heard was K1ZM, with 1010 QSOs and around 100 multipliers.
He was single-op.

Conditions here were fair Friday and poor Saturday. There didn't seem
to be much dx activity this year. I ended up with 710 QSOs and 83 mults
using a 100' long dipole fed with 600 ohm open wire. It seems to get
out ok, but I missed a lot of weak ones that I couldn't hear through
the QRN well enough to work.

I agree with the other postings: this IS a very nice keyer. I was wondering if the authors have any plans to make the source code available. I notice that the 68HC705C8 has a serial port and built in async communication capability. A keyboard interface would make a nice enhancement to the project.

In fact, since the software recognizes CW from the paddles, a CW reader with terminal interface may not be very hard to do. I read in the latest issue of Monitoring Times that one comercial stand-alone CW reader uses this same processor.

Cross-posted to: comp.os.misc,rec.ham-radio

Some of us here at ISC are looking into developing a new interface
for the famous KA9Q program under Unix. While KA9Q works under Unix,
it is a monolithic program handling all client and server tasks.
We would like to split this apart such that clients and servers need
not run as the same process.

To do this, we envision something like:

```
Clients....Clients...Clients....
\------|--------/-----\
Networking Layer------Scheduling Layer
| |
O/S Specific Interface Layer
```

The above approach would allow to develop clients and servers to use
a specific set of networking and OS call and not worry about whether
we're running AX.25, TCP/IP, SNA/LU6.2 et al. on Unix, DOS, WIN 3, AmigaDos
et al.

First question:

What should a multi-processing interface library allow access to?

Process creation, destruction, task prioritizing etc...

What should a networking layer handle?

Set up, Teardown, vc byte streams, datagrams et al.

Comments as always, are welcome...

I have spotted several Chicago Police and Illinois State Police
cars with four equal spaced antenna on the roof. The antenna are about 16 inches
long. I believe that this is direction finder equipment for Lojack devices.

This seems exaggerated. I have been involved neither in actual ham radio
nor in the newsgroup, but have known the meaning of the word for ages.

Do you really want those who don't know what a ham is to post?

Errrr, what is not standard about rec.ham-radio? Other than the
inhabitants, what is unconventional about it? It tells you right off what
it is, certainly better than things like comp.sources.d (what, the next
language after C?)

Just because there is a rec.radio.* is not a reason to change
rec.ham-radio.

Whereupon Mr. Kaufman attempts to argue with said logic and concludes with the rhetorical,

>So which is it to be... road safety or more revenue?

This is getting well outside the world of ham radio, but still touches on some-thing I find curious. When I got my ticket I'll have to admit to joining into a few sideband ragchews. One thing that struck me about the common mentality I tended to find there (American sidebanders) was precisely this authoritarian bent Dave Heller demonstrates wherein the collective good is presumed to be so much more important than individual liberties and is viewed as being so dependent upon the welfare of the individual that society as a whole (meaning, of course, government) has an obligation to restrict the individual's liberties in those areas where exercise of the liberties might allow him to do harm to himself. I think this was one of the founding principles of California, so it doesn't surprise me to see this in the locals, but it seems to me that this is also characteriscit of American hams in general, or at least the sidebanders. By and large, these people tend to be in favor of mandatory seat belt laws, probably would support the mandatory earthquake insurance law California just passed, are distinctly intolerant when it comes to issues of drug use, etc. Maybe this is just a function of the average age of the U.S. ham population. Does anybody know? Why ARE American hams such rednecks?

I heard the Shuttle tonight on it's circa 11:30 pm pass (12/6/90).
Boy! They fooled me! When I first turned on my scanner to 145.51 MHz I
thought I was listening to someone down the street yaking on the
Shuttle frequency! It turned out to be one of the crew members,
not Ron P. but someone else, talking to his family. I was using
my Radio Shack PRO-34 with NO preamp and a 19" whip antenna. Pre-
sumably Ron was in control of the transmitter as any good ham would
be. I guess the earth-side of the conversation was in Houston TX area.
This was a ~55 degree max elevation pass.

This depends on what you want in the subgroup. I believe most everyone wants to see the "no code wars" and the "pizza patch wars" put away in this subgroup. But what about issues like "antenna covenants" and stuff like "urban zoning" as it relates to ham (excuse me, amateur) radio?

Also there are legal issues related to radio but NOT amateur radio, such as the issues related to listening to private transmissions. Maybe we need:
rec.radio.legal
or even:
rec.radio.moral :-) [smiley means I am NOT serious]

This is yet another opportunity to further promote a more modern amateur
radio service and shrug off the "ham" concept which is some people's minds
is someone "hamming it up" on a radio in a way much like CB.

> I'd also advocate mv'ing the parent group into a .misc group

Usenet changes newsgroups often (read news.groups) and there should be
in place some administrative or automatic function to keep things up to
date there. Why don't you offer to help do it?

Really now, should the rest of us be bound to limitations which are the
cause of one or a few systems having insufficient system administrator
resources or competency? I say we should not. Sorry, Mike.

It has my support. As I mentioned before I believe it could readily show
that there *IS* a difference. Lots of people still don't know there is a
difference between ham or amateur radio and CB radio.

> save some bandwidth (and sanity).

If someone has a legal issue, such as:
is it legal to...
is it illegal to...
we should remove rule...
we should add rule...
and cross posts it, then the the problem is with someone who is simply
not thinking about what they are doing. Eliminating ALL these groups
would clearly get rid of that problem. Of course we don't want to do
that. The difference between "legal" and "rules" is small, but there
is some. The NON-rules things would be left out. Maybe that is what
the consensus wants in which case ".rules" would be appropriate.

> the way it is now (probably averages about 8 articles/day), so expanding
> it seems to be logical.

That seems like a reasonable argument. While there might be some reason
to separate amateur-only swap posting so that they can be fed into a
packet network, that might be a BAD THING by encouraging the lack of
someone (carbon based unit) filtering the messages. But this is a matter
for rec.radio.amateur.legal when it comes online (presumptuous aren't I).

> Another idea, though I don't feel too strongly one way or the other

This is probably where r.r.a.tech or such might be better. Where would
you like to classify transmitting voice by digital, but not packet, means?

3788. need antenna information

Newsgroup: rec.ham-radio
Date: 1990-12-07 06:50:56 UTC
From: dale@sequent.uucp
Message-ID: <48002@sequent.UUCP>
Source record: 5888

HELP! I need an "outside" antenna. My "temporary" attic dipole is driving me crazy. After putting ferrite beads and caps on my alarm siren I can run about 40 watts on 10 Meters before I drive it (alarm power supply disconnected) and 100 watts on 40 Meters if I get the antenna tuned really well. But my "smart" furnace thermostat consistently is reprogrammed when I transmit and tries to heat the house to 90 degrees. But enough of my sad tales...

I plan to put up a vertical mast 30 feet, and run a G5RV, plus perhaps a couple short dipoles at a later date. I think a tower might be a fight to get up, but think the mast with a few wires will be OK. My lot is somewhat triangular, 106 ft in back, 68 ft in front, and 100 ft deep. House is 43 ft from back fence. Plan is to use inverted V, with 10 ft mast sections (or house) at ends of wires.

I have heard that there are a couple variations on the plans for the G5RV. I would like to run coax through the attic to a balun under eaves, and then the open wire line to the dipole. I've heard of this both with and with out the balun. I'd like access to 80, 40, 15 and 10 meters at this time having a technician class license.

I'd like to solicit net opinion on the "ideal" antenna for my situation. And specifically on variations of G5RV design. All plans seem to use the 102 ft dipole, but what length of open line, and 300 or 600 ohm open line, should a balun be used and if so 1:1 or 4:1, and what length of coax?

I'll summarize any replies coming directly to me. Thanks.

Did they really? I recall hearing about radar decoy transmitters, that
were being placed adjacent to highways to trip radar detectors. So
this is illegal?

I had a somewhat similar experience at a former apartment. Everything
was working fine until the landlord decided to replace the water pipe coming
into the house. (It was all gunked up on the inside so that if more than
one faucet was on at a time the water pressure disappeared.) Anyway, as
soon as the contractor cut the old pipe a big spark shot out of it and
the AC voltage in the house went UP! I'm not sure how high (I wasn't home),
but I'm guessing 220V. Apparently the ground (neutral) at the utility pole
wasn't hooked up or something of the sort, so that the only ground was through
our water pipe (until it was cut).

Anyway, we lost most of the smoke detectors, light bulbs, a doorbell, and
I think a radio or TV set downstairs. I don't think the utility paid
anything. Fortunately, all my stuff survived; it was off at the time.

At the risk of repeating an earlier posting, Much of the stuff that
we want to leave behind:

Code/No code

The legality of using a police autopatch to order a nuclear attack
on a baby gay whale.

The thinly disguised broadcasting of hatred on amateur bands.

Etc. etc.

The people who are making the most noise on these things are probably
far fewer than the numbers who read rec.ham-radio. They may be
incapable of ever changing their opinions, but they are not stupid.
They are preaching, trying to change everyone else to their viewpoint.
when they realise that their audience are not reading -legal or -rules,
simple - they just cross post to everything !

I hope this isn't old news. I recently picked up a DX-440-on-sale, as well as a service manual for same, and soon set about trying to figure out how to make it receive one sideband or the other.

After getting past a delusional fixation I had about needing additional IF filters, I tried someone's advice: use the narrow (4 kHz) filter, and shift the BFO up or down 2 kHz as is needed to receive the proper sideband. It works! And rather well, indeed.

Great, but to shift the BFO you will have to get inside the unit. The "BFO" control on the front of the DX-440 only shifts the 1st LO -- it doesn't affect the BFO frequency at all.

The one to twiddle is VT103 on the A-1 assembly, which is a 100 pF trimmer capacitor in the BFO xtal oscillator circuit. Of course, doing this means that you're stuck with one or the other sideband mode after you reassemble the radio case.

I'll be puttering around in the next week or two with ways to make the mode switchable, preferably with a minumum of holes cut in the case. I'll most likely use diodes to switch in another trimmer or two.

In any event, if you've been putting up with QRM while listening to the shuttle, the above adjustment might be worth it to you.

-take a hard look at the 570 first. It's cheaper and does what most folks
-want right out of the box. If you don't really *need* remote touchtone
-control, it's a real win.

Maybe I should mention my experience with my 570T. It performs flawlessly in most respects, but it does have one _very_ annoying feature. If you want to store a repeater frequency that requires a CTCSS tone, it will remember the tone just fine, but it won't remember to transmit the tone when that channel is selected! You must manually select whether or not CTCSS tones are to be transmitted, even though the actual tone is properly stored in memory. UGH! This means that you must remember which repeaters need tones and manually switch on/off the CTCSS feature every time you stop scanning. Does anyone know how to fix this? I called Alinco and they said that that's the way it is, and tough. Their suggestion was to get a 590T! I'm not scared of ripping into the radio to fix it. Any help anyone can give me will be greatly appreciated!

> rec.radio.amateur.packet

In the library world, this is known as "Dewey Decimal Syndrome" - a strange neurotic compulsion to categorize things down nearly to the finest grain, regardless of the usefulness of the categorization to those people attempting to use them. This is a mild case, but clearly it's the thin end of the wedge.

Should there be created such a group as .legal (or .pilpul, or whatever) how many are going to subscribe to it? Or is this just a thinly-disguised case of NIMBY - an attempt to get all those people who insist on talking about legal issues to go away and stop bothering you?

A brief reminder as well: dots in newsgroup names indicates branches in the tree-structured hierarchy of groups. They're not just namepart separators. The dash character is more appropriate for that.

Finally, I'm moderately proud to be called a "ham radio operator"; I think it's nicer than being called an amateur (as opposed to "professional"). I think the people who want to be called 'amateurs' instead of 'hams' are being overly formal - like insisting on being called Robert instead of Bob.

I don't have the version number handy, but the latest 7K ROMs have linking capability, improved flexibility in message processing (selection of which xmtr to send the msg to) and more words for the voice synthesizer, among other things. Call them at (303) 663-6000 for details. (It sounds as if you've got a very early revision.)

I love to modify radios but I thought I might add my 2 cents worth here.
Everything you say here is correct but this mod will not buy you anything.
With a 4KHz filter your radio will still receive 4KHz worth of spectrum,
only about half of which will ever be the intended SSB signal. Shifting
the BFO to the low side of the IF <will> enable USB only reception, but
it will be just as noisy. As you suspected, you need a more narrow filter
(about 2.4 KHz for SSB). I think I would leave the BFO centered and still
be able to copy both sidebands. If you want to know which sideband you
are listening to, remember this: If you shift the frequency <up>, a USB
signal will go <down> in pitch and a LSB signal will go <up> in pitch.

with the Space Shuttle Columbia. { This is my confirmation! }
^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Equipment used: Yaesu FT727 HT, a 25 Watt brick, 100 feet of RG-8X, and
a homebrew J-pole at 100 feet. Approximately 10 Watts EIRP.

Interestingly, KA6NEI had a QRZ message in the first pass that said he already
had QSO # 1056. But the QSL beacon had him as being QSL # 1076.

The next pass had no sign of KA6NEI in the beacon, even though his connect
was one number away from mine (his 1137, mine 1138).

The way I see it, either his DM packet wasn't heard, or his connect was
tossed out by the robot after it checked for dupes.

There has been some amount of confusion locally as to whether the robot
is really ignoring the dupes, since it has been assigning new QSO numbers
on each pass. Anyone who knows for sure, please let me know what's going on.

Aloha, hope everyone that tried managed to get through to STS-35!

3803. ? 2m/440 Duplexers

Newsgroup: rec.ham-radio
Date: 1990-12-07 16:53:13 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <1252@west.West.Sun.COM>
Source record: 5835

I've been wondering whether it would be easy to build a 2m/440
duplexer like the kind that Larsen sells, or they type which
is made by Diamond or Kenwood?

I haven taken one apart yet but I assume that all they contain is
a ferrite core and perhaps a few stragegic windings?

Can anyone post a diagram of a simple duplexer for this purpose?

I listened and listened and listened. Never heard it that I could tell.

What's the criteria for the two frequencies?

How much do you guys vary frequency off of one before going to the other?
Which one is primary?

(I want to scan between the two on my channelized receiver.)

Neither East Coast nor West Coast,

> r.r.a.swap might be better as just rec.radio.swap

I'd rather see this too.

I'd also like to see rec.radio.cb so that CB related stuff would have
a place to be without being flamed to death and rec.radio.amateur.tech
(or perhaps just rec.radio.tech since the shortwave folks would also
be interested in the same things) for technical discussions.

The current proposal does not split rec.ham-radio into smaller
subgroups. All it does is rename the existing ones. Rec.ham-radio becomes
rec.radio.ham. rec.ham-radio.packet becomes rec.radio.ham.packet. The
only new thing is the creation of a .legal (.rules or whatever) group.

There are three groups now. The same three will exist, adding only the
legal one.

A better proposal would be to simply add rec.ham-radio.legal. It
accomplishes the same thing as the longer proposal does, with less work
and confusion.

I agree 100% with the above! Since we are going through the process, lets
get the names of the groups to correspond to convention. Also lets
make the group names descriptive. Get rid of the "ham" and substitute
amateur!

While I am not sure that rec.radio.amateur.legal is the best name for the
^^^^^
additional group, I do not have a better suggestion so will go along with
this until a better idea comes along.

This is utter nonsense! One groups administrative problems, either
real or perceived, do NOT constitute a logical justification for opposing
real progress which is needed in this case.

This is not a flame. Special event stations are neat. It just struck me that I see the phrase "all bands" a lot when only the five traditional HF bands are meant. I think this reflects a mindset in amateur radio that may result in there only being five (or seven) bands left for ham radio some day. Pity.

If any straight but sloped horizontal antenna within a half wavelength or
less of the ground, it will tend to be directional toward the lower end.

> 2. rec.ham-radio.packet
> Superseded by rec.radio.ham.packet
> 3. rec.ham-radio.swap
> Replaced by rec.radio.ham.swap

The fallacy of this proposal as I see it is that rec.radio.ham.legal will consist of cross-posts to/from the base group. The purpose of many of the posts that prompted this proposed reorganization of the groups is to wake up amateurs to the political implications for the survival of amateur radio of many regulatory matters. These posters will continue to cross-post in an attempt to get the widest readership. In addition, many of the postings that the reorganizers want shifted to legal are triggered by posts in the base group and will continue to be answered in the base group until a flurry of postings begging for the thread to be taken to legal are received in the base group. This is not the intended result of this reorganization. A better plan (IMHO) is as follows:

1. rec.radio.ham.bland
A safe smug little hole for those offended by controversy. No posting of mods allowed. No postings about antenna matching allowed. No code/no-code postings allowed. No mention of autopatches allowed. No mention of the future of amateur radio allowed. No postings about VECs allowed. No mention of using amateur radio in aircraft or trains allowed. Don't even use the letters A R R L in this group. No content allowed.

2. rec.radio.ham.misc
A general replacement for the current rowdy base group.

3. rec.radio.ham.swap
The swap group works relatively well, though for sale postings do
continue to be seen in the base group.

4. rec.radio.ham.packet
The packet group works relatively well, though it too seems full
of cross-posts lately.

Don't even THINK of renaming the groups "amateur" rather than "ham", that's
MUCH too controversial.

We just got through with a nice 82 degree high pass here in Honolulu.
It peaked at 7:54 pm local time tonight, December 7. I made sure that plenty
of people heard about it by talking it up on the statewide repeater system.
Everyone expected a loud packet pass.

I went up on the roof of my condo, about 100 feet AGL, with binoculars,
handheld, and 4 element beam. Invited some neighbors to come look for
the shuttle and listen to the commotion.

Unfortunately, it was too long after sunset, so no one spotted the shuttle.

However, WA4SIR surprised us all by coming up on voice! Several
astonished hams managed to make contact during the pass. I heard about
2 minutes of the downlink with my IC-2A and 4 element handheld beam, and
a visiting ham in Waikiki heard WA4SIR on a handheld and ruber duck!

Gee, I wonder if Ron just wanted more DX QSL cards? *grin*

Who do we need to talk to about spliting rec.radio.shortwave and ham.radio?

At the moment some items posted in ham.radio automaticly also make it into radio.shortwave.

I subscribe to both and do not really want to read them twice.

Is the magic word here, BANDWIDTH.

In the course of researching the demise of the carrier pigeon as a species, I was recently reading an offical Signal Corps history of their involvement in W.W. II. Just out of a sense of boredom,(I've been working on this project TOO LONG!) I started to look up references to amateur radio. The history had glowing things to say about the Amateur Service, including a report filed after a visit to ARRL headquarters in (then) Hartford, Conn., and the formation of the Army Amateur Radio System (AARS, which I assume is the precursor to MARS). The book continues with saying that "the attack on Pearl Harbor, of course, ended all amateur radio work in the United States", and just drops the subject. I can't find any more references until far after the war was over. In a word, what happened? I can't find any other sources to back this amazing statement up. Did every amateur station in the country go into mothballs "for the duration" ? Did Congress (or the governing body of amateur radio) just outlaw all ham transmissions? By what reasoning? It would seem to me that amateurs, particularly those with fox-hunting experience, would be quite useful to combat domestic spies, etc, etc, etc.... Any of the older hams on the net remember this time period? What happened?

Perplexed,

R. Todd Perry

According to a press conference yesterday (12/7) a SAREX/Mir conversation is scheduled for 9d7h30m MET, with more information forthcoming.

Also, I was able to monitor WA4SIR calling CQ around 0433Z 8 Dec on an ICOM 2AT w/rubber duck in W Lafayette, IN... Sort of surprised myself.

From: lee@tosspot.wang.com
Message-ID: <ZZHVT2w163w@tosspot.wang.com>
Source record: 5840

Y'know, for the first time ever, I've decided that it might be
a good thing if amateur radio finally became a thing of the past...

Yesterday (a Friday) I was home sick, so I thought it'd be really
nice to copy the PA0AA/PI4AA club bulletins on twenty (14103).
These guys have been on the air for about thirty years now, same
time, same place, and I've sent them the odd report now and then
for almost twenty of those years.

So I'm copying their Dutch news xmission (cw) and one of God's
divinely appointed american amateurs (at least in his mind)
shows up. Anyway, asshole starts sending (keyboard generated) cw
over PA0AA, asking 'em to please QSY to the cw portion of the band.
This does no good of course, 'AA is sending tape/whatever itself.
Still, he keeps it up for the entire cw news broadcast, of course, he
gives no callsign.

So, time for the voice portion of the transmission.

Two people show up on voice (both sounded like older people) asking
why they have to listen to this every Friday afternoon. No calls
again, what's the odds one of these two was the cw policeman?
They carry on bitching and whining......and bitching...and whining...

I used to think that amateurs were slightly special people - y'know -
interested in things outside their back yards, willing to help fellow
hobbyists, generally tolerant folk. Turns out that being an amateur
just gives you the ability to be an asshole with an audience of thousands
if the fancy takes you......and those of us that tolerate these people
are every bit as bad because we can't be bothered to do anything about it!

God, I'm pissed! What with the zoo on 313 and Bouvet, perhaps we really
don't deserve to be allowed to exist as amateurs. I used to say that
the 313 zoo made me proud to be an amateur........"G" amateur, that is,
but I'm not even sure of that any more.

Okay, anyone have any suggestions upon which we can act to clean up our
act? The ARRL and the FCC don't care, so perhaps it's time we got our
own house together?

Oh, I live in NH, not G-land, by the way so I've seen both sides of
the US/EU hf attitudes.....

> I'm talking about, and it has nothing to do with "sharks" and "guppies."

And I was talking (as well you know) about the immorality of the FCC using beating up on us guppies as a smokescreen to hide the fact they can't/won't deal with the sharks. In fact, by failing to deal with the shark class violations, they encourage guppy class violations. If they'd deal with the sharks, the guppies would take the hint.

> > Are we to infer from your constant references to the fact that you

Neither does your predilection for trying to drag red herrings across the path of everyone who is less than totally thrilled with the way the League mismanages things.

> Also, as you very well know, my postings
> here do not represent official League policy.
> If people insist on

Then why do your postings in this thread contain repeated references to your part in the briefing of FCC staff members by ARRL staff members? If you're not speaking for the League, why drag its name into the conversation to lend

credibility to your statements?

> (For some reason, I'm really starting to warm up to the idea of
> rec.ham-radio.legal. Although rec.ham-radio.flame seems more
> apropos.)

Right. Brand everyone who disagrees with Newington as troublemakers and segregate them into some ghetto where noone will notice when they ask embarrassing questions like, "Now that the loss of 220 - 222 mhz is final, who was it at HQ who failed to see to it that the FCC technical people had constantly updated rather than outdated ARRL repeater directories?"

The S.S. Ham Radio has hit another iceberg and is sinking by the bow, but by God, the officers on the bridge are in full uniform and saluting in proper Bristol fashion to the very end.

I'm not arguing against changing the name, but at the same time I think you underestimate the degree to which 'radio ham' has over the decades become a widely understood term among non-hams.

> real progress which is needed in this case.

What is the real progress? Changing the name from rec.ham-radio to rec.radio.amateur is not progress of any kind, much less "real". It is just "change".

Since there was an affirmative reply to the post of one site against it, then there are obviously TWO sites. If there are TWO, then there are probably more.

In fact, EVERY site will have to go through the trouble of changing the newsgroup names, feed and fed information, etc. All for what? A simple name change? Will this happen without incident? Ha ha ha.

The only real change is the addition of a .rules or .legal subgroup, which could be done WITHOUT any other name change.

Your post is yet another wild claim of perceived benefit with no justification provided, and it the only utter nonsense here. I have asked several times for a real justification for this change, and NOBODY has answered. The only "reason" so far is "it's a new name". So what?

Will it stop the cross posts? Hardly. Does it describe anything better? No. Will it change ANYTHING, other than the name? Ha ha ha. No.

Your claim that a name change is real progress is the same as claiming that all New York City needs to do to solve it's problems is rename itself to South Bend, Indiana.

I'm not arguing with the logic of the mechanics. I'm arguing against the attitude that produced the desire for the new mechanics. I believe that it is dangerous to believe that ignoring the very real political problems we face will make them go away.

> >In rec.ham-radio, sde@larry.sal.wisc.edu (Scott Ellington) writes:

One troubleshooting tactic, strange as it may sound, is to turn the rig on with someone watching the TV set with the TVI, and go about whacking on things metallic. Disturbing the metallic oxide junction should produce a radical change in the TV display.

To avoid being fitted for a sports jacket with wraparound sleeves, do this at night while meowing loudly. On second thought, send someone else to do it.

Doubtful. In the first place, how do you prove it? All the police chief has to say is that he was gathering traffic flow statistics.

In article <oHqVT4w163w@phoenix.com> stanley@phoenix.com (John Stanley) writes:
> In fact, EVERY site will have to go through the trouble of changing
>the newsgroup names, feed and fed information, etc. All for what? A
>simple name change? Will this happen without incident? Ha ha ha.

This is, of course, false. For starters, the vast, vast majority of sites take everything. The next most common layer gets rid of the talk groups, and the one after that, soc and rec. So, the actual number of sites that will have to make adjustments to their distribution file is very small.

About five years ago, USENET went through a very major name reconstruction, for the most part without incident. Frankly, the proposed shift should have been done then, but that's hindsight.

> Your post is yet another wild claim of perceived benefit with no
>justification provided, and it the only utter nonsense here. I have asked
>several times for a real justification for this change, and NOBODY has
>answered. The only "reason" so far is "it's a new name". So what?

I went into this extensively about three months ago. To reiterate, the change is necessary to better integrate the newsgroups into the developing USENET hierarchy. USENET is not a static entity. The population is growing exponentially, and the number of groups is growing linearly with time. Thus some tendency to order is justified. There is no good justification for RHR's second level domain status, as the tree that is developing under it is directly related to the tree growing in rec.radio. Given that rec.radio is the better organized tree, it only makes sense to direct growth of the smaller tree (RHR, and growth into rec.ham-radio.legal) off of the other tree.

> Will it stop the cross posts? Hardly. Does it describe anything
>better? No. Will it change ANYTHING, other than the name? Ha ha ha. No.

Empirically not true. While .d groups have not drawn off all of the flames from the mainline groups, they have been for the most part effective. Frankly, the ham subculture of armchair lawyers is pretty well defined (I say that being one of them); there are some people who do NOT want to be part of that subculture. The flames resulting from a few thoughtless crossposts should be enough to pen in the obnoxious.

> Your claim that a name change is real progress is the same as claiming
>that all New York City needs to do to solve it's problems is rename
>itself to South Bend, Indiana.

Similar claims were made during the aforementioned Great Reorg, as well as the Internet move to domains a few years back. Remember host tables? Heh, thought so...;-)

=========
SpaceNews
=========

MONDAY DECEMBER 10, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* SAREX NEWS *
==============
Dr. Ron Parise, WA4SIR, has made hundreds of packet radio contacts with
his Amateur Radio station on board the space shuttle Columbia. Telephone
bridges were set up to enable school children to talk with the latest
ham in space. Ron has also been making some voice contacts. The primary
downlink frequency for all SAREX operations has been 145.550 MHz.

* MIR NEWS *
============
Soyuz TM-11 has successfully docked with the Mir space station complex
currently on Earth orbit. The Soyuz spacecraft carried Soviet cosmonauts
Musa Manarov, Viktor Afanasyev, and Japanese journalist Toyehiro Akiyama.

* OSCAR-21 NEWS *
=================
The launch of AMSAT-21/RM-1/RS-14/RUDAK-2 has been postponed until 07-Jan-91
so that a Soviet official may witness the launch.

* FEEDBACK *
============
From Franklin Antonio:

In article <378@ka2qhd.UUCP> kd2bd@ka2qhd.UUCP (John Magliacane) writes:

>* MINI-TUTORIAL *
>=================
>The first person to investigate elliptical orbits thoroughly was the
>mathematician and astronomer Kepler. He formulated a set of rules for
>elliptical orbits and was able to demonstrate that all planets followed
>such orbits in their motions around the sun. Over 100 years later, orbital
>elements defined by Kepler are still being used by astronomers and satellite

>trackers worldwide.

Actually, it was a __long__ time ago. Kepler published his work on elliptical motion in "seu Physica coelestis tradita commetariis de motibus stellae Martis" in 1609! This contained the first two laws: orbits are ellipses, and equal area = equal time. In 1619, he published "De Harmonice Mundi", containing the third law, which relates distance to orbit period. In 1620, his mother was arrested for witchcraft.

So, the basic work was done 371 years ago! This is one of the humbling things about celestial mechanics. I'm sure I wouldn't have been able to figure this out, yet Kepler did it 371 years ago. Obviously, he didn't have computers. Most people don't realize that he didn't even have the benefit of a telescope. The telescope was invented around 1609; Galileo pulblished in 1610. The observations that Kepler used to develop his theory were made by Tycho Brahe, many years earlier.

===

John,

Thank you very much for your Keplerian elements tutorial in SpaceNews (90-12-03). You know, this was the first time I have seen any explanation of what Keplerian element sets actually represent, in sufficent enough detail to permit me (or anyone else, for that matter) to write tracking software.

>Any help anyone can give me will be greatly appreciated!

This is so true. I just leave tone on for all repeaters, programming the
lowest tone possible for repeaters that don't require tone. Nobody notices.

easy. Committed suicide by literally walking out of a window ten stories up. Seems he just wanted to give up fighting for the rights to own FM.

Too bad. If he lived, he could've seen that he won in the end, and see the rise of FM in this country.

>to say is that he was gathering traffic flow statistics.
>--
>Jim Grubs - via FidoNet node 1:234/1

The FCC isn't going to approach the department without proof that they were using dummy radar. When an FCC engineer goes to one of the radar gun sites, he'll see a radar unit sitting there, with probably a gel cell or something powering it, and that's it. If the PD was gathering "traffic flow statistics", they'd need some means of recording the statistics they gathered, i.e. either some type of computer with a storage device, a printer of some sort, etc.

Also, when agencies like the Department of Transportation or the National Highway Traffic Safety Administration set out to get traffic statistics, they use special radar guns that are not on the standard X or K frequencies for the sake of getting unbiased readings. If they used standard guns, they would set of detectors, and they would end up getting averages below what is typical.

IMHO, an FCC engineer will recognize this ploy as pure BS.

>shows up. Anyway, asshole starts sending (keyboard generated) cw
>over PA0AA, asking 'em to please QSY to the cw portion of the band.

14.103 IS the CW portion of the band here in the U.S. The extra phone
portion only goes as low as 14.150.

>Still, he keeps it up for the entire cw news broadcast, of course, he
>gives no callsign.

How did you know he was an American if he didn't give his call sign?

Maybe I'm missing something here.....

In a word, yes. Hams exist at the mercy of the federal government and the military will always have the right to usurp any and all of our frequencies. This month's (December 1990) QST has a very good summary of the history of amateur radio that will provide a much better answer than my typing.

I am interested in buying a Cushcraft R5 20/17/15/12/10m vertical.
If you have used it, please mail me your opinion of it. I am particularly
interested in how high it must be mounted to avoid interaction with
metal below it. I will be mounting on a apartment roof with metal siding
around it. Cushcraft claims the R5 only needs 6-7 feet of clearance to
avoid interaction with objects below the plane of the radials. I am
also interested in the effiency of the antenna. Thanks in advance.

IMHO, no FCC engineer is really going to care anyway.

and besides, If the radar gun is on it's performing radio telemetry.
It doesn't matter if you're looking at the readout or not. If an air
traffic controller looks away from his scope is he breaking the law
too?

> (Stuff about US hams deliberately QRMing bulletin deleted.)

I don't think it would be too difficult to convince the powers-that-be
to make amateur radio a thing of the past. It seems to be getting so that
it is virtually impossible to conduct any type of useful scheduled or
organized activity on ham radio due to QRM, both deliberate and unintentional.

For example, I was listening to the WA3NAN (Goddard Space Flight Center)
space shuttle audio rebroadcast last Sunday night. There was a station
sweeping his VFO across the frequency sending di-dah continually. Later,
a couple of stations got on the frequency and started a QSO; hearing WA3NAN
but not knowing what it was. (These guy probably hadn't read QST in 30 years.)
They refused to move when another ham got on the frequency and politely
explained what the broadcasts were, why they were legal, and that they were
of interest to large number of amateurs. The two didn't think that these
broadcasts belonged on ham radio and carried on, ignoring the fact that
they were needlessly annoying lots of other hams. This was "their"
frequency for "their" sched. A 3rd voice then jumped in and added that that
WA3NAN was at fault, since it was supposed to be on 3860, and this was 3858.

My feeling is that the only reason ham radio still exist is because of
the many instances we've documented where we've saved lives in disasters
and provided public safety communications. If we lose the ability to
provide these communications because certain people disagree with them and
cause QRM or because other people are so out of touch with the happenings
in ham radio that they don't even recognize a disaster net in progress and
don't have the sense to QSY, we will lose amateur radio altogether.
It is, for example, OK to question the validity of the 14.313 activity in
the porper forum. But to QRM it only demonstrates our inability to
provide orderly communications.

Many hams need to chill out a bit and realize that the airwaves aren't
theirs exclusively. If the rag chewer can appreciate the fact that
a great many hams enjoy contests, and if the DX-chaser can appreciate
the fact that some stations actually enjoy QSOs with people in far away
places that go beyond a simple "59" without having to endure accusations
of "hogging the DX," methinks we will all be happier.

Greg

I recollect that it started on I-75 in Kentucky. The local PD bragged about
it to the media when confronted. Someone requested an opinion from the FCC
which said that it was a No-No. The FCC did not cite them (as far as I know),
but they desisted.

I was wondering what procedures one has to go through to obtain a
US amateur radio license. I currently have a class A license (GW4WFX) in
Britain but will be in the US for a number of years where I am at grad.
school. Can I just get a reciprocal license or do I have to subject myself
to some other procedure.......??????

Any advice would be appreciated.

Nic.

3860. Re: CALL FOR DISCUSSION: rec.ham-radio reorganization

Newsgroup: rec.ham-radio
Date: 1990-12-09 16:07:37 UTC
From: geertj@philica.ica.philips.nl
Message-ID: <721@philica.ica.philips.nl>
Source record: 5865
Cross-posted to: rec.ham-radio,news.groups

If (When) we make the switchover to rec.radio.{ham,amateur}.*, it might
be a good idea to make a FAQ message and send it once a while.

It happens that once a while, a casual reader writes a message in the
wrong group, the most common error seems writing in rec.ham-radio what
should be in rec.ham-radio.swap.
Usually, this results in a flame storm to the mailbox of the offender,
and sometimes on the net as well.

It seems to me that the distinction between rec.radio.ham and
rec.radio.ham.legal is less clear than the swap group.
As a result, I think that more articles are mis-posted, and with the
dynamic properies of this group, the flaming remains!

Also, a FAQ might give an answer to some flame-prone questions, like
taking various equipment onto air flights, etc.
One question from an innocent beginner and the group is filled for the
rest of the month!

Other thing: Like Brian, I too would like to keep 'ham' instead of
'amateur'. At least here, broadcast band pirates and the like also
call themselves 'amateurs'.
Moreover, I usually find a new interesting newsgroup from a list
with descriptions (like a checkgroups message), instead of just the
name. And, yes, I like 'ham' too, even if (or because) there is no
similar word in Dutch or German as far as I know of.

Finally, I'd like to propose 'rules' instead of 'legal'. Bandplans,
for instance, have no legal meaning here, just 'gentlemen's agreement'.
If discussed, I'd like to see that in the rules group, because
of the traffic involved. The way I see it, 'rules' is for all rules,
not just the ones issued by the government.

That's my stuiver's worth. I'm interested in your opinion.

RTTY DX Notes 1of3 12/7/90

RTTY DX Notes for week ending 7th December 1990
BID: $RTDX1207
Part 1 of 3.

Please, when reporting intended DXpeditions to some rare place, would
the person reporting indicate where this rare place is? My geography
is fairly good, but where the heck is Morokulien? Which brings me to
another point. Considering present and past operations, one would
assume that some of the DXpeditions have very little interest in RTTY.
We had one to the north who worked very little RTTY, and one to the
south who admitted that they were not interested in RTTY. One must
ask, should we support these operations if we are to receive no
benefit? Maybe we should have more RTTY only operations. At least it
is worth thinking about.

Our thanks this week go to DJ3IW and the Saar-Pfalz DX Club Packet
Cluster, I5FLN and his packet cluster, JA1BLV, OD5NG, TG9VT, VK2EG and
WB8RJX. Thank you all for your excellent news. We do seem to be
missing one of our regulars. Hope that the birthday was not too much
for you Jules.

SB RTTYDX @ ALLBBS $RTDX1207B
RTTY DX Notes 3of3 12/7/90

RTTY DX Notes for week ending 7th December 1990
BID: $RTDX1207B
Part 3 of 3.

C56/6W6JX says to QSL to Box 200, Kaolack, Senegal. Do not QSL to his manager for this operation.

ZB2JB will QSL via Box 292, Gibraltar.

PJ8DFS indicates that his manager is SM5AQD.

LU5DF/CX expects all his cards to go to LU5FSB, who will do the QSL chores.

XU1DK, Toru, says the short address for his QSL is Box 80, Koujimachi, Tokyo 102-91 Japan.

Notes of Interest:

XU1DK states that the power is cut off at 1500Z each day, which makes it a little difficult to operate after that time.

Kure Island, KH7, should show up as KD7P/NH7 from 12th December. He expects to be there until 21st December. QSL to his home address on Guam.

PA3DUU will operate from Morokulien with the call of LG5LG from 22nd December to 29th December. His QSL manager is LA9DFA. (Don't ask me where that place is.)

HA9RE and HA8XX are planning a South Pacific DXpedition toward the end of the year. They will start from Chatham Island as ZL0AAD and ZL0ADN. After two or three weeks they will go to Rarotonga for

another two or three weeks, then they proceed to Niue Island as ZK2XA and ZK2XB for about the same period. QSL to DJ1ND. They would like some dontaions to pay for their trip.

3W3RR, Romeo, informs that his trip to Spratley will be delayed because he now has permission to operate from Afghanistan, as YA0RR. He expects to start at the end of December. He needs donations too. Send them to Edward Kritki, Box 715, Brooklyn, NY 11230 USA. QSL address and frequencies will be announced later.

No, it is far from automatic. Someone deliberately cross-posted the first article. It might have been a question that was appropriate for both, at first. Then, as the discussion grew towards ham radio in rec.ham-radio, and towards the SWL side in r.r.s, nobody took the effort to un-crosspost the postings, so now you read the same thing in two places.

> I subscribe to both and do not really want to read them twice.

rec.aviation and sci.aeronautics suffers from the same thing. sci.chem and rec.pyrotechnics, at times. Life is a beach.

I don't get it! Do you mean he sits by the side of the road, waiting
for someone to come by with a radar detector, and then just guesses the
speed without turning the gun on?

Or do you mean he paces the car by following it? In this case, he
would never use radar anyway.

Please clarify.

(Various descriptions of ham purgatory were deleted)

There was a fiction article in one of the ham magazines in the 1960s
where the deceased ham finds himself in what must be a ham paradise
in the hereafter. He is shown a HUGE station, with every kind of exotic
antenna available...all the latest gear, big amplifiers, etc.

But when he gets on the air and calls CQ, no one comes back...and he
can't hear anyone either.

When he complains to his hosts, they say: "Just where did you think you
were? This is hell."

Don't overcomplicate the problem! All it takes is an auxiliary officer with a pencil and a notebook.

> Also, when agencies like the Department of Transportation or the
> National
> Highway Traffic Safety Administration set out to get traffic statistics,
> they use special radar guns that are not on the standard X or K
> frequencies
> for the sake of getting unbiased readings.

To find out the fans on the way home from the Michigan - OSU game are pushing it a bit? Come now.

> IMHO, an FCC engineer will recognize this ploy as pure BS.

An FCC engineer, even if he cared, we would be hard put to demonstrate that this is not VTO enforcement. The purpose of enforcement is to ensure compliance, not to rack up a lot of traffic court 'kills'. If the radar trips a few fuzzbusters while the watch commander is deciding whether to run a trap, well, that's life.

While I will agree that Newton established all the fundamentals for
the CM, that he did grind the 2-body problem to dust, and that the
science of CM is indeed four centuries old, I cannot agree to calling
the later work "footnotes" or dismissing the following works as being
un-verifiable.
This argument is similar to one that may be made in "showing" that
all of science and engineering boils down to Physics, or that the only
truly original discoveries appear in some esoteric branches of
Physics, and everything else follows.
The point is not that the basic problem of CM has remained unchanged
for the past four centuries. It is that all the variations on that
problem have prompted some remarkable contributions from a large number
of mathematicians, and more importantly, these contributions have had
implications far beyond just CM.

I know of one person locally who is currently doing this with the rec.ham-radio groups specifically. I am sure I'll be able to do so as well, once I get my machine (robohack) operational again, though I will probably want to restrict the service to the local area.

[Stuff about unmanned radar guns being used, the FCC finding them, etc.]
>IMHO, no FCC engineer is really going to care anyway.
>

Apparently they did. They terminated this practice in Georgia where they were using radar guns mounted to roadside poles. They also stopped the Pennsylvania State Police who had been putting old radar guns in highway maintainence vehicles, median lawn tractors, etc.

>and besides, If the radar gun is on it's performing radio telemetry.
>It doesn't matter if you're looking at the readout or not. If an air
>traffic controller looks away from his scope is he breaking the law
>too?

It doesn't matter whether or not somebody is looking at it. It DOES matter whether or not there is someone there to control the emissions. Radar guns aren't classified as telemetry equipment. The license is for radiolocation. FCC regs also state that this type of device must be manned. Also, a radar detector is a radio receiver. If somebody is interfering with its use, that is, somebody is setting it off without a reason for transmitting, that is also an FCC violation. See part 15 for more info. Radar guns are part 15 devices, from what I remember.

Message-ID: <9012092236.AA12518@cmr.ncsl.nist.gov>
Source record: 5780

KB2JAC/9 wonders what happened to ham radio in W.W. II. For an extremely brief summary, I suggest the December 1990 QST, wherein there is a short accounting as part of the review of the last 75 years of ARRL.

All US hams were ordered off (by the FCC) on December 8, 1941. There were all sorts of worries about spies. Hams, in general, were not presumed to be any less likely to be sending "secret" messages - thus off the air to reduce the work of the monitoring folks. Many hams ended up in the service, and most work weeks in factories were 6 full days. This didn't leave a lot of free time. There was a War Emergency Radio Service (WERS) in association with Civil Defense, which attracted quite a few hams. It was on the old 2-1/2 meter band 112-116 MHz, using AM (sometimes modulated oscillators) and superregenerative receivers. Awful performance. I was a bit young for such things, and didn't know any active people in Richmond, VA., where my family was moved with the US Patent Office "for the duration". The Patent Office was sent out of Washington to make room for more immediate war agencies.

The Washington Radio Club continued to meet throughout the war, kept alive by among others, its YL members such as W3CDQ and Fran Darne (call forgotten). Amateur OPERATOR licenses continued to be issued, and some of my now-friends (ie: W3XO) got tickets during the war.

3870. FCC Rumor -- (But what if it is true?)

Newsgroup: rec.ham-radio
Date: 1990-12-09 23:19:12 UTC
From: pbhx@ellis.uchicago.edu
Message-ID: <1990Dec9.231912.8685@midway.uchicago.edu>
Source record: 5783

Gawd -- don't you hate rumors! How about this one we picked
up overnight in Chicago.

On December 13, the FCC will make its long awaited Communicator Class
announcement. But the shocker will what else they announce on that
date: that element 1B will no longer be required for General and
Advanced and that element 1C will no longer be required for Extra.
Yes, the hot rumor is that the 13 wpm and 20 wpm requirements are dead
and that one will only need to demonstrate code proficiency at 5 wpm
for *ANY* amateur license (excluding, of course,the Communicator
License which will be code free.)

The FCC can do this, because, as I pointed out in the following
post I made here on November 6, while code proficiency *is*
required by international agreement for HF work, speed above 5 wpm
is *not required.*

(Now, just wait until Thursday, and watch the FCC blow this rumor
away.)

On November 6 I posted:

:>In article <7880341@hpfcdc.HP.COM>
ajs@hpfcdc.HP.COM (Alan Silverstein) writes:
:>
:>So it seems clear to me that it's an improper REQUIREMENT. Regardless
:>of how easy it is to learn, regardless of how nice or fun or efficient
:>it is, if it's not something you must know to be a successful ham and
:>to contribute to the hobby, it's an improper requirement.
:>
:
:Alan, the unfortunate thing is that it is required by international
:agreement for work on the HF bands. However, what is NOT required by
:that agreement is speed above 5 wpm. Since we HAVE to have code for
:HF, we should test ONLY at 5 wpm. If people think it would be nice to
:show greater proficiency than 5 wpm, let's roll that into the written
:exam process by adding questions to the written. I.e., let's add 5
:code questions to the extra, increasing the questions asked to 55 and
:the passing score to 41. That way, if you fail the five code
:questions, you don't fail the test.

3871. Communications Quarterly

Newsgroup: rec.ham-radio
Date: 1990-12-09 23:44:16 UTC
From: kchen@Apple.COM
Message-ID: <47226@apple.Apple.COM>
Source record: 5781

A little while ago, Ron Todd posted information on how to
get a subscription to Communications Quarterly (cute pun, eh?).
Well, too late for me, but they also have a toll free number

(800) 457-7373.

I subscribed blindly (not regreting it at all, after reading the
first issue), but for the curious, the first year's subscription
is $27.95. The price per issue is listed as $9.95 on the cover, but
I have not yet seen it surface on newstands that hawk CQ and 73.

A little pricy, but IMHO (except for a minor nit), it is a *much*
better bang-for-the-buck than either CQ or 73. There is not a single
mention of a contest! I would have paid an extra buck for that :-).

In the first issue, there is everything for a LowFER nut to
people addicted to the HBR-xx articles that used to appear
in the QSTs of the good old days. Not surprisingly, the whole
thing has a Ham Radio (the publication) "feel" to it.

I am a little disappointed at the number of errors when
equations came into play, though. Slightly weak technical
editing, perhaps? Not just in one article but everywhere an
equation appears, almost. E.g., note the variable of integration
in the first equation of the DSP article; similarly, the summation
index of the inverse Fast Hartley transform in the same article.
Notice that the Hanning window in that article evaluated to be a
constant! :-) Tsk, tsk. Bad sign for an article that is a tutorial.
The article on S-parameters carried similar sloppiness - h22 in
Figure 2 should not be dimensionless and they invented a new
symbol that I have never before encountered for the dimensionless
h12 :-).

But, anyway, perhaps nobody depends on equations published in
Ham publications, so who cares, eh?

Still, if the future articles maintain the interesting technical
mix that appears in the first issue, they can be assured that I
will continue to subscribe. I only wished that I didn't have to
wait three months for the next issue! When was the last time you
said that after reading CQ or 73 (sorry, W2NSD :-)?

So, for those of you who are sitting on the fence: go for it!
If anything, it will show them publishers that there are still
Hams interested in the technical aspects of the hobby.

73 and keep building 'em thar gear,

Kok Chen, AA6TY kchen@apple.com
Apple Computer, Inc.

I don't recall a prohibition against receiving radar in the ECPA. Does that mean there is explicit Federal permission? If so, aren't state laws making radar detectors illegal preempted by ECPA? And what about out-of-state vehicles? If radar detectors are legal in the state your car is registered in, isn't it impermissible interference with interstate commerce to bust someone for driving through another state with one?

Too bad no one has the time or money to persue this and maybe kill such laws once and for all.

>
> What is the real progress? Changing the name from rec.ham-radio to
>rec.radio.amateur is not progress of any kind, much less "real". It is
>just "change".
>

John, I have to ask how can a logical person say that a name change to
better describe this group to tens of thousands of sites worldwide is not
progress?

Merriam-Webster defines real as: Authentic, genuine, actual and true.
Progress is defined as: To develop a higher, better or more advanced stage.
How can you state that it is not progress of ANY kind? Are your criteria
different than that of the international dictionary? If so, why?

> Since there was an affirmative reply to the post of one site against
>it, then there are obviously TWO sites. If there are TWO, then there are
>probably more.
>

Maybe not, and if so, so what? The majority consensus will prevail as defined
in the net rules established for creation of new groups. Two sites MAY be 2
no votes if they even take the time to vote.

> In fact, EVERY site will have to go through the trouble of changing
>the newsgroup names, feed and fed information, etc. All for what? A
>simple name change? Will this happen without incident? Ha ha ha.
>

What trouble?
Since you obviously are not up to speed on group creation, removal etc, a
short education is in order for you. Many sites have AUTOMATIC new group
creation enabled. Those that do not, require a simple intervention by the
news administrator. I am the news administrator at this site, so don't
try to snow me with how difficult this all is!

> The only real change is the addition of a .rules or .legal subgroup,
>which could be done WITHOUT any other name change.
>

Wrong. See defininition of "real" above.
Sure it COULD be done without any other changes.
If you are not going to change something with the goal to make it as near
perfect as something man-made can be, why bother at all?
Do you approach all your projects with an attitude of why bother to do my best?

> Your post is yet another wild claim of perceived benefit with no
>justification provided, and it the only utter nonsense here. I have asked
>several times for a real justification for this change, and NOBODY has
>answered. The only "reason" so far is "it's a new name". So what?
>

The JUSTIFICATION was stated at the beginning of the reply as well as by
numerous other posts on this subject. The only wild claims were made in
your emotional original post and reply.

> Will it stop the cross posts? Hardly. Does it describe anything
>better? No. Will it change ANYTHING, other than the name? Ha ha ha. No.
>

I've seen some negative posts in the last 4 years in this group.
You should be proud to be right up there with the worst of them, providing
NO rational basis for your claims. You are guilty of the very same error
you accuse me and others of making.

> Your claim that a name change is real progress is the same as claiming
>that all New York City needs to do to solve it's problems is rename
>itself to South Bend, Indiana.
>

This is an extremely inaccurate analogy. I never claimed that the name
change would provide a solution to this groups problems. Maybe next time
you should spend as much time reading as you do wasting bandwith with
inaccurate analogys, erroneous and inflamatory claims.

>to be a trend.

That's an argument against ANY change, not just the name change and group addition. And it's also largely a problem with ALTnet and ALTnet only. Assuming that the people who are working on the mkgroup authentication hack finish fairly soon, this will be a moot point, in any event.

> Hmmm. News.*, comp.*, rec.*, talk.*, sci.*. Rec.ham-radio seems to fit
>quite well in the rec.* hierarchy.

Yeah, the same what alt.swedish-chef.bork.bork.bork does.

This does not justify having ham-radio as a second level domain, which is the principal contention.

> Moving rec.ham-radio down under rec.radio will do nothing to reduce
>the growth.

Never claimed it would. It does however make that growth easier to manage.

> It will do nothing to sort out the traffic into more
>appropriate places. Creating .legal (or .rules) will help, but could be
>done much more easily as a subgroup of rec.ham-radio. Imagine, any site
>not wanting rec.ham-radio.legal need do NOTHING, versus creating a new
>set of groups and deleting old.

Contradiction #1. You claimed earlier that it was a royal pain to hack the distribution. Now you claim that they "need do NOTHING". Uh huh.

> There is no good justification for third level status, either. Is
>being at the second level really a status symbol? If so, then we should
>be the LAST ones to suggest a change.

No, there's not status associated with domain level. The justification for hanging the ham-radio tree under the radio tree is both intuitive and obvious. In fact, hyphenated domain levels are seen as being somewhat archaic...

> What will moving down a level do to traffic? It will increase it. It
>seems, from my experience, that feeds often do the easiest thing for
>them. If you ask to have rec.arts.startrek added to your feed, they will
>probably add r.a.*.

This is only a problem if you assume that the readers of rec.ham-radio are not interested in the rest of the rec.radio hierarchy, an assumtion that is false for the most part. Now whether they have the time to read the entire hierarchy is a different matter...

>Now you have all of arts being stuffed down your
>throat, using your bandwidth, filling your junk. (Junk is the highest
>volume group, here.) So, moving under rec.radio means you will get all of
>rec.radio, like it or not. A waste.

The usual cause of "junk" filling up is a mismatch between your distribution and you active files. Bnews (and presumably Cnews) junk articles that they can't find an active entry for. If your "junk" is in fact your highest volume newsgroup, then it sounds like your site is misconfigured. Remember, just because "you" don't subscribe to a group doesn't mean the system won't keep the group around for others to read.

> Which rec.radio is related to packet? Maybe the best thing to do is
>just be subsumed under rec.radio.noncomm. Not rec.radio.noncomm.amateur,
>just r.r.n. There is pitifully little traffic in r.r.n now, so we would be
>able to take them over with little effort.

The purpose of the hierarchal structure of USENET is to divide posts into meaningful structure. What goes on in r.r.n has little to do with Amateur Radio (read the group charter). Moreover, your suggestion of "taking it over" is childish at best.

> If it made any sense to change, then yes. Since there is NO benefit to
>changing, then there is no sense to change. I haven't seen the arbitrons,
>but my impression is that rec.radio.noncomm is nearly dead, and
>rec.radio.shortwave is mostly crossposts from r.h. Which tree is smaller?

It's quite clear that noncomm has little if anything to do with ham radio. It is quite clear that ham radio has something to do with radio. At least the last time I took E&M it did, anyway.

> Where in the suggested change was the .d group? Aren't discussions
>still going to take place in rec.radio.amateur?

Jay and I hashed this out about a week or two ago. Basically, .legal IS meant to be the debate (old term for .d groups) group for the r.r.ham (at this point most likely ham => amateur).

> I agree with the suggestion to add rec.ham-radio.legal. It can be
>quite simple to do that.

There is no difference in difficulty between adding rec.ham-radio.legal only and adding and deleting four newsgroups. You still have to enter emacs only once, if at all.

On the whole, the name change is more of an administrative change than anything else. If nothing else, it allows for a more logical growth in the tree structure for future splinter groups off of the ham radio discussion section. Certainly, the name change does't address some of the other problems (for example, traffic volume) that currently exist. But it

does make addressing those problems easier, and at a very minimal cost.

SB ALL @ AMSAT $ANS-342.01
SAREX MISSION IN REVIEW

HR AMSAT NEWS SERVICE BULLETIN 342.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

SAREX Operations Generally Successful

Starting off with a smooth launch and a "nominal trajectory," STS-35 lifted
off in a spectacular night time launch with two gigantic white pillars of fire
trailing behind. Aboard the shuttle Columbia was Ron Parise (WA4SIR) and the
Shuttle Amateur Radio Experiment (SAREX). The SAREX consists, on this
mission, of a packet radio ROBOT TNC-2 and a 5 watt FM transceiver. Operating
only during his work shift, over a 1000 contacts have been logged. During
his "spare" time, Ron answers questions posed by inquisitive school children.
Thanks to the efforts of relay stations in Australia (VK5AGR, VK2AS, and
VK6IU) and in Brazil (PY2BYO), school children from over forty schools got
to hear Ron tackle some very difficult questions about space science and
spaceflight. Rich Ensign (N8IWJ), an astronomy and science teacher in the
Detroit area who has been monitoring these sessions is quite impressed with
the questions that have been asked of Ron.

Reports from all over the world have been pouring in about the successful
"connects" packet stations have made with WA4SIR. One factor which made
communicating to WA4SIR difficult, if not impossible, has been Columbia's
attitude. Because the ASTRO-1 experiments have required shuttle attitude
adjustments, the window-mounted antenna on the pilot's side, i.e., on the
right side above the centerline, has not always been earth-pointing. N3FKV
notes that when the antenna is pointed away from Earth, as it has been on
several occasions, signals have completely disappeared. However despite this
problem, when all the QSO's are counted, it will be seen that the SAREX packet
```

ROBOT station was a major success.

One of the final milestones yet to be achieved is a QSO between U2MIR and WA4SIR before Columbia returns on December 10. There was a very close approach between Mir and Columbia this week, so close in fact that they were only a few dozen miles apart. In what was a coincidence, Musa Manarov (U2MIR), the most active of the amateur radio operators ever to have flown aboard MIR, has been returned to the space station this week. It is hoped that toward the end of the mission of STS-35 the the first QSO ever between "space mobiles" will take place.

For those who have made a packet contact with WA4SIR and would like to receive a QSL card, please send your QSL card, QSO number, and an S.A.S.E. to ARRL Headquarters.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 342.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

The AMSAT Engineering Team has issued a Microsat status dated 5 DEC 90:

AO-16 is in the ROM safe mode expect for PHT telemetry which was activated by 6 DEC 90 5:00 UTC.

AMSAT's worldwide network of microsat command stations detected a change in the average battery voltage on the early evening US east coast passes on 4 DEC 90. The battery voltage was very low at the end of dark pass, 9.7v instead of the nominal 10.4v (battery voltage is one of the most important parameters to monitor, which explains why so much interest is placed on its well being). Command stations Bruce Rahn, WB9ANQ and Jim White, WD0E, noticed things were not as they should be, did some initial analysis, and bumped the problem up to N4HY and NK6K.

WD0E changed the power management limits on the mid US pass in hopes that this would stabilize the system. It was decided that if the average voltage continued to decline, AO-16 would be manually placed into the ROM safe mode, which would recharge the batteries. On the west coast pass, the battery voltage had climbed back to 10v. AO-16 was left running, in the hope of gathering data from stations on the day side of the orbits.

Alberto (I2KBD) and Carlo (IW2CTJ) did acquire daytime telemetry on following passes, N4HY determined that AO-16 was charging at an erroneously small rate. By the next US east coast pass, the onboard software had gone to its low voltage protection mode, which uses a transmitter setting of a few 10s of milliwatts. After gathering additional diagnostic information to verify that it was a software rather than hardware problem, N4HY forced AO-16 into the ROM safe mode. This mode does not use dynamic power settings, and will recharge the batteries. The problem is believed to be software only, and is likely to be related to a recent software change to increase efficiency of the BCR

during dark passes.

Interestingly enough, spacecraft hardware engineers had requested that the operations group do a 50% discharge on the batteries soon, to gather data and to erase Ni-Cd "memory". As this has now been done, albeit under somewhat less controlled circumstances than planned, that procedure will no longer be necessary.

This problem is unrelated to problems with commissioning of the file server; work in that area continues. The latest version of the file server is up and running on UO-14.

[ANS thanks Harold Price, NK6K for the information for this bulletin]

U2MIR RETURNS TO THE AIR/SPACE

HR AMSAT NEWS SERVICE BULLETIN 342.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

Amateur Operations aboard MIR re-commences

Within two days of returning to the Soviet Spacestation MIR, Musa (U2MIR) has resumed amateur radio operations. WA1OMM reports that he had a short QSO with Musa on 145.55 FM on 06 Dec 90. If you will recall, Musa was very active during his first assignment aboard MIR. It is unclear as to how long Musa will be assigned to MIR on this go-around (pun intended). MIR's 51 degree inclination orbit makes it accessible for just about all of the amateur population (Columbia's 28.5 degree orbit makes it very difficult for stations much above 40 degrees in latitude to get a good shot at the orbiter).

Although Musa's arrival on MIR was too late to attempt a contact with WA4SIR onboard Columbia, there may be an opportunity toward the end of Columbia's mission when the two spacecraft will be within a few hundred kilometers of each other. (Approximately every 7 to 8 days the orbits of the two spacecraft 'allign' allowing visual and direct radio contact.) If that occurs, Ron and Musa will attempt the first ever US to Soviet orbiter communication. This QSO will also be note-worthy in that the commander of the Columbia Astro-1 mission is Vance Brand, who participated in the Apollo-Soyuz Mission in 1975 and it is expected that Vance will have a few words to share with the Soviet Cosmonauts.

In January, MIR is scheduled to receive a packet radio experiment package which is to be permanently installed on MIR. It will use a standard TNC employing AFSK (FM) modulation of AX.25. Besides operating in packet mode, it will also have a voice synthesizer which will transmit greetings and general information in English, Russian, and German. The 'Club' Station on MIR has a dedicated exterior antenna and it is expected that the permanent station setup will make it convenient for the other cosmonauts to occasionally pick up the mike and make a few QSOs. If you missed having a QSO with WA4SIR, try listening for Musa and the gang on 145.55 (simplex).

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 342.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

Schedule of ZRO Tests, Fall Edition

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday December 15, 1990 at 1630 UTC "B"
Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 342.05 FROM AMSAT HQ
SILVER SPRING, MD December 8, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

15 Dec 90 97 J/L 1400 N5BF WD0E Saturday

A new schedule covering the period after 26 December 90 will be issued shortly.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13.

Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-342.06
FALL AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 342.06 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 8, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140 <--- QRP on Mode B Please
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

This schedule is expected to continue through 26 Dec 90.

The command team requests that you make a specific effort to use QRP on Mode B between MA 135 to 140. This is specifically to help those people experimenting with Mode S. (Although you really should always keep checking that your peak signal is never stronger than the beacon (145.813/435.651 MHz)

The spacecraft attitude of AO-13 is calculated to be:

BLON = 179.7 and BLAT = -3.3 for 17 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

BLON = 4.0 and BLAT = 0.0 for 15 December 90

3878. Additional TH-75 mods.

Newsgroup: rec.ham-radio
Date: 1990-12-10 03:40:51 UTC
From: brent@network.ucsd.edu
Message-ID: <4189@network.ucsd.edu>
Source record: 5786

Here are a couple more somewhat useful modifications to the Kenwood TH-75 dual band HT, in addition the the previously posted mods for talking to the Police and Sheriff.

I. Kenwood somehow got the idea that their HTs don't require a hole in the case of the radio for the microphone. On their earlier HTs, and on the 75, the microphone is conductively coupled to the case of the radio, rather than having some hole for the audio to pass through like other manufacturers have. For higher fidelity audio and that comfortable living-room stereo sound, I highly recommend drilling a hole in the case of the Kenwood. (Remove mic element first...) A couple of holes can be discretely drilled near the speaker grille just above the last "4" of the "144/" marking on the front. For fuller audio, drill a bigger hole. You should also place a small piece of cloth between the mic element and the case when you put everything back together to cut down on wind noise.

II. I was disappointed Kenwood didn't have a trickle charge feature for the battery pack when you plug the radio into an external DC source. This is easily modified, and the result works well keeping a 50ma. charging current to the battery.
Remove the front panel of the radio and the top knobs. CAREFULLY unsnap the top plastic cover with the volume markings, etc. Remove the five screws holding the TX-RX board to the back panel. (You must remove the TSU-6 to get to the 5th screw.) Lay this board on the bench so the foil side is facing you. The external DC-in jack has three solder leads arranged vertically holding it to the board. Jumper the upper two leads toward the top of the radio. This insures a negative lead connection to the battery pack with 12V plugged in. Next, solder a 100 Ohm resistor across the large diode labeled D2 at the bottom of the board. This provides the 50ma. (approx.) charging current to the battery. Reassemble the radio.

- These are a couple handy mods and will insure that when you call your emergency in to a police dispatcher, your audio will be clear and your battery charged. But, don't forget and leave the 12V plugged into the radio for a couple days and fry your battery pack. The things are damned expensive, and I take no responsibility for the use/abuse of the above mentioned modifications.

Brent

>for *ANY* amateur license (excluding, of course,the Communicator
>License which will be code free.)
>

I like it! I don't _believe_ it but it strikes me as a long-overdue modernization.

People talk about how a "no-code" license will lead to a "no-theory" license. It seems to me that the opposite is the case. The "code forever" people (especially ARRL) are adamantly telling us that we must _keep_ the Novice class _because_ its theory requirements are minimal! Never mind TCP/IP, folks, Morse is the wave of the future! -)

>trap, well, that's life.

Jim, I think you lost the thread here. We were talking about unmanned radar units being put along highways for the sole purpose of tripping detectors. You're right in saying that a officer who is making a stop, or just driving around and ignoring the radar gun probably won't get cited for having an uncontrolled transmitter operating. I was talking about roadside radar guns that are left on continously for the sole purpose of tripping detectors.

3882. Amateur Radio Reorganisation (Revised Proposal)

Newsgroup: rec.ham-radio
Date: 1990-12-10 06:58:24 UTC
From: randall@Virginia.EDU
Message-ID: <Dec.9.22.58.58.1990.15980@turbo.bio.net>
Source record: 5790
Cross-posted to: news.groups,rec.ham-radio,news.announce.newgroups

I propose formally that Jay's proposal be expanded and revised
as follows. Discussion should occur in news.groups per the USENET
Guidelines. If Jay is willing to collect votes on this sort of
proposal, I'd suggest he be the one to make the formal CfV and
such at the appropriate time.

PROPOSAL:

There should be three votes run in parallel (that is, use one ballot and CfV):

1) Move the existing Amateur Radio heirarchy (keeping all existing groups)
FROM rec.ham-radio.* TO rec.radio.amateur.*

2) Make the existing parent group (rec.ham-radio/rec.radio.amateur) into
an equal level group with the rest (rec.ham-radio.misc/
rec.radio.amateur.misc)

3) Create a new group for legal/rules discussions (rec.ham-radio.legal/
rec.radio.amateur.legal)

RATIONALE:

The heirarchy shift would make the whole USENET namespace more consistent
(see rec.radio.shortwave and rec.radio.noncomm) and makes the Amateur Radio
groups easier to find for those non-Americans who aren't up on US-specific
radio jargon and would find the Amateur Radio groups more easily.

The moving of the "parent" group should help reduce cross-posting (this
has been seen widely across the net) and also makes the namespace more
consistent.

The creation of a legal group would split existing traffic in a clear
manner and make it easier for all readers of the Amateur Radio groups.

Discussion should take place in news.groups per the USENET Guidelines.

3883. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-12-10 07:59:40 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901210005940.23800372@HG.ULeth.CA>
Source record: 5793

/\/\/\

Aside from Region 6397, the only other region to produce any significant minor flaring was Region 6410, which spawned a class M2.8/1N flare at 08:21 UT. This flare borders as a long-duration event, maintaining energy output for 65 minutes. However, it's location (N02E79) will prevent it from having any geophysical impacts on the earth. This flare is suspected of producing a moderate-duration, moderate-intensity SID/SWF. However, this has not yet been confirmed.

The background X-ray flux, which is (among other things) an indicator of the intensity of solar activity, has increased over the week with the appearance of the numerous new solar regions. It is currently holding at an X-ray level of C1.5.

Geomagnetic and auroral activity this week was notably low. The only exception to this was on 04 December when geomagnetic activity increased to unsettled levels over most latitudes. High latitudes experienced a few brief periods of minor storming. But other than that, activity remained relatively low. Auroral activity was visible over high latitudes and northerly middle latitudes on the evening of 04 December, but returned to generally non-visible levels for the remainder of the week.

HF radio propagation conditions were normal to above normal this week, due in part to increased ionospheric ionization and low geomagnetic activity. MUF's experienced a respectable increase over the last week and are now approaching (and exceeding over some paths) 50 MHz.

VHF propagation has been good this week, with increased prospects for DX on the lower-frequency VHF bands (ie. near 50 MHz). There have been no significant opportunities for auroral communications this week, however several SID's (particularly the one accompanying the major flare of 04 December) were capable of enhancing VHF propagation over the sunlit portions of the earth.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to reach its peak during this week. The solar flux is expected to peak somewhere near 245-250. The sunspot number (currently 288) could break 300 before the week ends. Old Region 6368, which contained a complex beta-gamma-delta magnetic configuration, is due to return between 11 December and 12 December. This region was extensive in area, but exhibited signs of decay and stabilization before it passed out of view several weeks ago. Models currently suggest that this region has probably detensified and returned to a relatively stable, less extensive and less threatening configuration. Remnants of this region should rotate back into view between 11 and 12 December, which should produce a notable increase in the solar flux.

There is a slight possibility that old Region 6368 has maintained its extensive size and magnetic complexity. Should this be true, flare activity could increase further over the coming week. This is, however, going against what most of the models suggest.

Geomagnetic activity is expected to remain mostly quiet until later in the week, near 15 or 16 December, when activity is expected to increase to

mostly unsettled levels. By near 19 December, activity should again return to quiet levels. Auroral activity should likewise increase near 16 December, peaking near 17 December. Periods of moderate activity are likely over high latitudes during this time. Middle latitudes will likely only witness periods of low activity on these dates, with a risk of sporadic moderate activity.

HF radio propagation conditions should be above normal this week, with significant possibilities for DX existing until near 15 December when decreased ionization and increased geomagnetic activity will hamper attempts at DX over many latitudes. There is a risk for brief flare-related short-wave-fades (SWF's) this week, due to the number of M-class flare-capable regions existing on the solar disk. The frequency of SWF's may increase if old Region 6368 returns with a complex configuration. Overall, this week looks like one of the better opportunities for HF DX.

VHF propagation conditions should be normal to above normal this week. The prospects for VHF DX are increased, particularly for those who work the lower VHF bands near 50 MHz. Daily MUF's are approaching 50 MHz at the present time and may be exceeding 50 MHz over some paths, providing potential openings on frequencies at and above 50 MHz. There is also a moderate possibility for flare-related VHF enhancements which might permit isolated periods of VHF DX.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 10 DECEMBER

```

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder,
Colorado for the past 87 hours. Conditions to the north of Boulder will
generally have slightly higher activity than Boulder, while conditions to the
south of Boulder will likely have lower activity than those depicted here.
However, the plots should present a good approximate average of planetary
geomagnetic conditions.
For information regarding the interpretation and/or use of these charts,
send a request for the document "Understanding Solar Terrestrial Reports" to:
std_oler@hg.uleth.ca.

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

```

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

I dont know about who has reviewed it but I can give it my personal
recommendation as one of my favourites. Can you get to meet one at
a local library? It is possible that a university library could give
you the opportunity to sit down with a copy for a few hours and form
your own opinion. The other books I'd recommend personally are:

Frequency synthesisers ..... Ulrich Rohde

The Art of Electronics 2nd edition Horowitz&hill

Single sideband circuits & systems (I think is the title)
A boot by Collins staffers including Sabine and Schoenike
as an update of the old pappenfuss/shoenike book

should see tou through a good few sleepless nights !

3885. DX[edition Summary

Newsgroup: rec.ham-radio
Date: 1990-12-10 12:01:20 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9012101201.AA13786@cmr.ncsl.nist.gov>
Source record: 5812

After many months of effort to get the reciprocal ticket, I spent 2 weeks in FG at the end of November - a 50 MHz DXpedition. As far as I can tell, there had been no 50 MHz activity from Guadeloupe since I last operated in 1983.

When I arrived, I dicsovered that F6EPY had arrived a week before; now TWO 50 MHz stations in FG! The F2 conditions were not kind to either of us. We had no contacts into continental Europe, and very few into the US. Dominique (F6EPY) worked a handful of Ws the first time I went to the bank. He is a very avid operator (and works for a Motorola sub), and brought his laptop computer with the CT program, etc. He stayed with friends about 25 miles from me.

After F6EPY left, I worked three F2 stations, and MISSED the only good opening into the US. Gotta forget the beach and sightseeing!

Summary: Continents: North and South America, Africa, Europe(CU)
Countries: FG, V2, J6, W, PY0, PY, CX, LU, CE, OA, ZP, CN,
CU, TR8, possibly 6W1
By F2: CN, CU, W

There was TE to South America nearly every evening for a number of hours. A new experience for me.

All-in-all, an unproductive DXpedition, but a good vacation.

73, Bob W3OTC (ex- FG/W3OTC very ex- FG0HZW)

Just try to explain the new portable PREFIX scheme to someone who is poor in your language , and you don't know his. (No YLs heard, so no pronoun complaint.

And this will, of course, upgrade all Technician licenses to General,
as the only difference is the code test. 80m phone, here I come!

> addition. And it's also largely a problem with ALTnet and ALTnet only.

That's right. If and only if the benefits of change are greater than
the cost is the change justified. In this case, it is not. The cost of
any change is the effort to implement that change.

> > Hmmm. News.*, comp.*, rec.*, talk.*, sci.*. Rec.ham-radio seems to fit
> >quite well in the rec.* hierarchy.

> Yeah, the same what alt.swedish-chef.bork.bork.bork does.

This is a problem with alt. In one breath you differentiate USEnet
from alt, and in the next you don't. Be consistent.

> This does not justify having ham-radio as a second level domain, which is the
> principal contention.

What justification is needed?

> > Moving rec.ham-radio down under rec.radio will do nothing to reduce
> >the growth.

> Never claimed it would. It does however make that growth easier to manage.

No. It will be just as easy under rec.ham-radio as under rec.radio.ham.

> > Imagine, any site
> >not wanting rec.ham-radio.legal need do NOTHING, versus creating a new
> >set of groups and deleting old.

> Contradiction #1. You claimed earlier that it was a royal pain to hack the
> distribution. Now you claim that they "need do NOTHING". Uh huh.

No, read what I wrote. If you do NOT want rec.ham-radio.legal, you
need do nothing at all. If you do not want rec.radio.ham.legal, you will
still need to mangle the news feeds to get rec.radio.ham. There is no
contradiction here.

> No, there's not status associated with domain level. The justification for
> hanging the ham-radio tree under the radio tree is both intuitive and
> obvious.

In your opinion. Above you say there is no justification for the
status of ham-radio being at the second level. Here you say there is no
status. This seems to be a contradiction.

> The usual cause of "junk" filling up is a mismatch between your distribution
> and you active files. Bnews (and presumably Cnews) junk articles that they
> can't find an active entry for.

Yes. I know that.

> If your "junk" is in fact your highest
> volume newsgroup, then it sounds like your site is misconfigured.

Or the feed is misconfigured. I have very little control over how they
configure, other than asking them to change things. They have already
told me "that's the way things are". I am guessing they are feeding me
the same groups that they feed others, to make life simple for them.

> Remember,
> just because "you" don't subscribe to a group doesn't mean the system won't
> keep the group around for others to read.

Yes, because I don't subscribe DOES mean the system will NOT keep a
group around for others to read.

> > Which rec.radio is related to packet? Maybe the best thing to do is

> meaningful structure. What goes on in r.r.n has little to do with Amateur
> Radio (read the group charter). Moreover, your suggestion of "taking it
> over" is childish at best.

So your claim that r.h.* is closely related to r.r.* is not
supportable. I think your suggestion to rename r.h just to rename it is
childish at best, but I try to argue based on the argument and not on the
personal characteristics of those I argue with. What, run out of rational
arguments already?

> It's quite clear that noncomm has little if anything to do with ham radio.
> It is quite clear that ham radio has something to do with radio. At least
> the last time I took E&M it did, anyway.

Of all the rec.radio, ham-radio is supposed to be the least
commercial. Even PBS stations are running adverts these days ("This
program was funded by ..."). So, we are more noncomm than noncomm. The
noncomm name fits us better than those who are there now.

> There is no difference in difficulty between adding rec.ham-radio.legal only
> and adding and deleting four newsgroups. You still have to enter emacs
> only once, if at all.

No. You must edit your active file. You must send mail to your feed to tell them to send you the new groups. If you feed someone, you have to edit the file that says what you feed (if they don't take everything already). That's at least two edits (my mail editor is emacs), maybe three.

> On the whole, the name change is more of an administrative change than
> anything else. If nothing else, it allows for a more logical growth
> in the tree structure for future splinter groups off of the ham radio
> discussion section.

You made this claim before, and it is still as false as it was then. It does nothing to allow a more logical growth. There is NO DIFFERENCE between adding groups under rec.ham-radio and adding them under rec.radio.ham. None. Zip. Nada. If rec.ham-radio can't grow logically as rec.ham-radio, then it can't grow logically under rec.radio.ham. Once again, the whole argument comes down to claims that are not supportable.

3888. TS430 Help needed

Newsgroup: rec.ham-radio
Date: 1990-12-10 15:11:31 UTC
From: frankjo@LONEX.RADC.AF.MIL
Message-ID: <9012101511.AA09520@lonex.radc.af.mil>
Source record: 5813

I recently installed an AM filter (YK-88A) in my Kenwood TS-430S. After doing so, I find that the narrow position no loger works. It is my understanding that wide should be 6 kHz and narrow should be 2.4 kHz. I have heard that Kenwood has issued a service bulletin to correct this problem but I have not seen it. Can anyone provide the information necessary to fix this problem? Thanks.

3889. Re: * SpaceNews 10-Dec-90 *

Given these articles in SpaceNews:

```
* SAREX NEWS *
==============
Dr. Ron Parise, WA4SIR, has made hundreds of packet radio contacts with
his Amateur Radio station on board the space shuttle Columbia. Telephone
bridges were set up to enable school children to talk with the latest
ham in space. Ron has also been making some voice contacts. The primary
downlink frequency for all SAREX operations has been 145.550 MHz.

* MIR NEWS *
============
Soyuz TM-11 has successfully docked with the Mir space station complex
currently on Earth orbit. The Soyuz spacecraft carried Soviet cosmonauts
Musa Manarov, Viktor Afanasyev, and Japanese journalist Toyehiro Akiyama.
```

I was wondering: If there are hams in the shuttle and hams in Mir,
both running 2 meters, have there been any space-to-space (ham) QSO's?

I realize that the altitude of the orbits is not enough to provide
significant mutual windows but the shuttle and Mir do occasionally
pass close enough to see each other. Last week I heard that they
passed within 30 miles of each other so it certainly is possible.

(maybe this time the Russians were too busy babysitting that whining
journalist...)

I apologize to the net for the bandwidth, but my note bounced and couldn't find
N4WMT in the call book.

Hi Bill,

You made it through the network just fine. I was not able to make it back to
you via E-mail.

Yes, I'm willing to share my 8-bit Atari programs. Most of my stuff is for
electronics. Much of it has been typed in from mag articles
and from Howard Berlin. I've also written some for particular applications.

What kind of programs do you have for the Atari?

It it will be easier to contact me via U.S snail-mail.

The Art of Electronics (Second Edition),
Paul Horowitz and Winfield Hill
Cambridge University Press
ISBN 0-521-37095-7
1125 pages plus front-matter

This is somewhat like The Radio Amateur Handbook (ARRL), but
in many ways is more up-to-date on basic circuit technology
and topologies, has more "under your fingernails" theory,
and has sections on BAD circuits as well as good ones!!
And you'll be VERY surprised at how many of those you've seen
published in various projects over the years.

This book is a rare jem indeed. Herewith is the table of
contents to varying detail....

The Art of Electronics, Horowitz and Hill

Chapter 1 FOUNDATIONS
Voltage Current and Resistance
Signals
Capacitors and AC Circuits
Inductors and Transformers
Impedance and Reactance
Diodes and Diode Circuits
Other Passive Components

Chapter 2 TRANSISTORS
Some Basic Transistor Circuits
Ebers-Moll model applied to basic transistor circuits
Some amplifier building blocks
Some typical transistor circuits
Self-explanatory circuits
Good Circuits
BAD Circuits

Chapter 3 FIELD EFFECT TRANSISTORS

Chapter 4 FEEDBACK AND OPERATIONAL AMPLIFIERS

Chapter 5 ACTIVE FILTERS AND OSCILLATORS

Chapter 6 VOLTAGE REGULATORS AND POWER SUPPLIES

Chapter 7 PRECISION CIRCUITS AND LOW-NOISE TECHNIQUES

Chapter 8 DIGITAL ELECTRONICS

Chapter 9 DIGITAL MEETS ANALOG

Chapter 10 MICROCOMPUTERS

Chapter 11 MICROPROCESSORS
A detailed look at the 68008
A compete design example: analog signal averager
Microprocesor support chipts

Chapter 12 ELECTRONIC CONSTRUCTION TECHNIQUES

Chapter 13 HIGH-FREQUENCY AND HIGH-SPEED TECHNIQUES

Chapter 14 LOW-POWER DESIGN

Chapter 15 MEASUREMENTS AND SIGNAL PROCESSING

Appendix A The oscilloscope
Appendix B Math review
Appendix C The 5% resistor color code
Appendix D 1% precision resistor values
Appendix E How to draw schematic diagrams
Appendix F Load lines
Appendix G Transistor saturation
Appendix H LC Butterworth filters
Appendix I Electronics magazines and journals
Appendix J IC prefixes
Appendix K Selected data sheets

>Herbie net, antenna restrictions, etc, etc, etc, technical?!. Yes, *PLEASE*
>let's setup a .tech subgroup (works for rec.auto).

There's more to ham radio than just technical subjects. The object of adding .legal and not .tech is to move the flames, not a subset of the non-flames. I am strongly opposed to a .tech group, and don't see the overwhelming consensus that one is needed that would change my mind.

Please continue this discussion in both news.groups and rec.ham-radio, as per the guidelines...

3895. Alternative proposal - The Grand Radio Reorg

Newsgroup: rec.ham-radio
Date: 1990-12-10 15:51:55 UTC
From: stanley@phoenix.com
Message-ID: <9k1yT5w163w@phoenix.com>
Source record: 5819

Since there is a great hullaballoo about reorganizing rec.[ham-]radio,
let's go the full 9 yards and have a grand reorganization. Following all
the arguments pro the change, here is a new proposal that will actually
do what the old one is claimed to do.

Deletions:

rec.ham-radio[.*]
functions to be assumed by new groups

Additions:

rec.radio.noncomm.pro
the new home for the professional, non-commercial radio
discussions.

rec.radio.noncomm.amateur
the top level for the discussion of amateur uses of
noncommercial radio.

rec.radio.noncomm.amateur.ham
the top level for the discussion of topics relating to
the Amateur Radio Services, and the equivalent services
in non-US countries.

rec.radio.noncomm.amateur.ham.misc
This group replaces rec.ham-radio. It removes traffic from
the domain, so that there are no groups that carry traffic
and serve as home to subgroups.

rec.radio.noncomm.amateur.ham.digital
this group replaces rec.ham-radio.packet, and includes other
digital modes.

rec.radio.noncomm.amateur.ham.swap
this group replaces rec.ham-radio.swap

rec.radio.noncomm.amateur.ham.rules
a new group for the discussion of regulatory issues, including
but not limited to code/nocode and PRC1.

rec.radio.noncomm.amateur.cb
a group dedicated to the discussion of the uses of the
Citizen's Radio Service, or equivalent in non-US countries.

rec.radio.noncomm.amateur.lowpower
a group dedicated to the users of devices classed under Part
15 of the US rules, and the equivalent in non-US countries.

A major component of the charter for this group is the
dissemination of the information that baby-monitors can
be monitored by anyone.

alt.ham-radio
a starter group that will allow anyone who wants to create
any group he or she wants, under the umbrella of ham radio.
Possible immediate new groups:
alt.ham-radio.spark.gap.zap.zap.zap.
alt.ham-radio.morse.code.dit.dah.dit
alt.ham-radio.reorg.of.the.week

Rationale:

This reorganization will serve to identify more completely the
groups, and allow easier growth. It provides areas for the discussion of
topics not currently covered. As ham-radio is a non-commercial usage, it
falls most logically under the noncomm name, and more specifically, under
the amateur usage of radio spectrum. This will, hopefully, serve to
reduce the discussions of the commercial or professional usage of Amateur
Radio in the amateur.ham.misc group.

To better identify the professional users, and to separate them
from the amateur traffic, a new group is formed for them. This eliminates
the problem of having a domain that also carries traffic. This is the
same reason for the creating of the .misc group under
rec.radio.noncomm.amateur.ham.

Note that the term amateur is used in its generic form. The usage
matches that used by non-hams. (Those poor souls who would like to become
one will identify first the noncomm heading, followed by the amateur
heading, and finally the actual ham group. Those searching for CB will be
able to easily locate the CB groups.)

Since this proposal actually does what the proponents of the other
proposal claim, they should be quick to accept this. If we are going to
change, we should at least do what we claim we are trying to do. If you
have trouble with this proposal, then you should really be having trouble
with the rec.radio.amateur one.

3896. Kenwood TH-27A review & info

Newsgroup: rec.ham-radio
Date: 1990-12-10 15:53:45 UTC
From: jpd@pc.usl.edu
Message-ID: <20432@rouge.usl.edu>
Source record: 5816

I'm posting this for Tom N5OFF:

I have been doing some experimenting with my th-27a, and have
found it to be an excellent aircraft receiver as well as a fine
two meter transceiver. It will also do full 136-174 MHz tx/rx,
but I have not yet found a mod configuration that will allow
full tx/rx AND aircraft receive at the same time (except the
asian config which I will describe below).

When modified for full 136-174 tx/rx in any of the western configs
the aircraft am is defeated (see chart below).

In the asian config, the rig becomes a versatile wide band receiver
displaying 118-174, 200-400, and will tx 136-174.
The problem with this config is that some of the keyboard positions become
relocated (see cross reference), and the processor reset defaults to
145.000 instead of 144.000.

So, can anyone out there shed some light on how to get full
136-174 tx/rx and preserve the relatively high quality
aircraft receive present in the western standard models?
I have included below my summary of the resistor combinations
that I have either tried, or otherwise know the functions of.

Any further info will be appreciated.

R334 R335 R337 W301 REMARKS
o - o o k,p us stock config
o o o o e 144-146 tx/rx no aircraft
o o o - e2 136-174 tx/rx no aircraft
- - o o m 144-148 tx/rx no aircraft
- - o - m2 136-174 tx/rx no aircraft
o o - o x not tried
o - o - us mars 118-174 rx 142-152 tx
o - - - us mars+ 136-174 tx/rx no aircraft
- - - o asian or jap stock
- o o - asian mod 118-174,200-400 rx,136-174 tx
o o - - not tried
o - - - not tried
o - - o not tried
- o - o not tried
- o o o not tried

"o" means resistor or jumper in place
"-" means open

TH-27a to TH-F27 (asian version) key relocations:

th-27a key = th-f27 key

tone/tone sel call/c-scan
call/c scan bell/step
3 talt 3 tone
shift/rev rev/shift
MHz/step MHz/band switch {118,145,340}

f1sec,3 : tone alert sound tone select

I have done the japanese mod on my th-27a, and find that
the button differences are easy to live with. All functions on the
rig seem to work in the japanese config except I don't think the
auto-dialer will dial a * or #. No big deal for me. It will manually
send a # or * though.

As stated earlier, the coverage of the rig in the jap config is

118-136 am rx
136-174 fm tx/rx
200-400 rx

I don't think the 200-400 works at all because I've compared it
to strong local signals on a scanner and heard nothing on the
th-27a. Aircraft rx is great! As good as a Bearcat 100/200, and
better than the Icom 2sat. The th-27a has a "real" am detector/agc
(see schematic).

To sum up: I love this little rig!

I don't have any problem with people who disagree with League actions.
I often disagree with them myself. What I have a problem with is
people who a) distort League actions and policy statements to make
their own case, and b) disagree with *everything* the League does
just because it's the League doing it.

> > Also, as you very well know, my postings
> > here do not represent official League policy.

> credibility to your statements?

I think I twice mentioned talking to the FCC, so I guess that constitutes
"repeated references." But I thought folks might want to hear from
someone who actually has taken the time to talk to the FCC and find out
what they really think, rather than making wild guesses. Sorry if what
they told us doesn't fit with your preconcieved notions.

If you don't understand the difference between speaking *for* the League
and my speaking *as* a League staffer, I suggest you consult a dictionary.

> Right. Brand everyone who disagrees with Newington as troublemakers and
> segregate them into some ghetto where noone will notice when they ask
> embarrassing questions like, "Now that the loss of 220 - 222 mhz is final,

> who was it at HQ who failed to see to it that the FCC technical people had
> constantly updated rather than outdated ARRL repeater directories?"

People who want to debate issues aren't troublemakers, but people who
make irrational and unsubstantiated charges are.

Speaking of red herrings... the date of their Repeater Directories is
irrelevant since the Directory doesn't (and isn't intended to) provide
band-occupancy data. Their misuse of the published information could
as easily have been done with any year's Directory (including the
current one).

I don't think I'll post any more on this thread. While I'm sure the
net readers are hugely entertained by it, I doubt it's adding much
of value to the legitimate debate of ham radio issues.

Source record: 5795

The Larsen is a hipass/lopass design, with crossover near 300 MHz.
The implementation is very good, and would be hard to beat
without a lot of work. The reason I say this is that the loss
of the duplexer is so low that I could not reliably measure
it on the HP network analyzer I was using. I think that the
PL-259 connectors represent a larger loss than the duplexer
itself. You could home-brew an equivalent, or even improve
upon it (by using type N connectors), but for me, I have too
many other time demands and projects to try to beat Larsen
on this one.....de WD5IBS (Chris Kelly)

Actually, this is very unlikely, because there has not been a
Notice of Proposed Rule Making (NPRM) for any such action.

>Ironically, if this rumor comes to pass, I could easily find myself
>running CW only. I can hear the displaced CBers stirring now, as the

Exactly. CW may be a better "lid filter" without the exams than with
them, as long as there continue to be substantial CW subbands.

I enjoy operating mobile CW and have used a straight key resting on the passenger seat for a year or so with mixed success. Recently, I put together the Super Keyer II (featured in November '90 QST) and am quite happy with it. However, the old paddles I've been using (from an old Ham-M keyer, I've been told) are just too sloppy.

Does anyone have any recommendations on keyer paddles and on mobile CW operation in general. Any advice would be greatly appreciated.

Source record: 5824

I just passed my novice test Dec 1 ! I am now working on my Tech!

I would greatly appreciate any advice an recommendations on setting up my shack, and purchasing radios and attennas. I plan on making my own antennas since most people I have talked to say that it's easy, inexpensive, and that these antennas get excellent reception. So my main concern is the eternal question: Which rig? I want to work phone on 10 meters as soon as possible since propagation is so good! I also want to do some CW and hope to eventually get my general license! There are so many different brands and models of radio! It's all very confusing. I also want to do packet sometime.

I've been told most transceivers are general coverage now? Is this true ? If not, would it be cheaper to get a ham bands only transceiver? Looks like I need an allmode all band HF rig. Any recommendations? Someone recommended the ICOM 735. Comments? How much would it cost used? Any other recommended brands or models? I am CS major that tends to like features and "gadgets" I think my personal preference would be an LCD display for the frequency, but I am told that it is sometimes better to get an analog tune.

Thanks in Advance!

No; it would not!
The rules changed a few years ago.
The current theory test for Technician is different from the test for General.
Upgrading to General would *still* require passing the *General* theory test!

Well, I can't argue with a working system!

I guess my telecom background is showing -- I've obviously been spending
too much time reducing buffer delays in my rate converters ;-)

One advantage of ham radio-style full duplex is that there isn't a two-wire-
to-four-wire conversion taking place at each end (the telephone "hybrid"
function). This eliminates the complication of having to deal with the echo
caused by imperfect line terminations at the hybrids (and in the in-line
analog repeaters). This echo is probably the driving factor in the delay time
specifications I work with.

This is good news to hear. It makes it seem much more practical to
send real-time voice hither and yon via the packet network!

In response to an article by Robert Casey:

-> have too low voltage. We like to set the voltage at 120V at
-> houses." He puts
-> a new seal on the meter in the basement. My father said that he
-> haden't seen
-> the insides of the meter box since 40 years ago, when the house
-> was built.
->

I have a simular problem here in Lima. AEP, our local electrical company, has been very poor in my opinion. Here at my home, the voltage rides from 117 to 127, which they say is in spec. At the TV station where I work, the power is as high as 132 volts at times.

A while back, the third leg would drop off occationally, dropping the transmitter. When the service man showed up he said that they were not having any problems, and we must have a "short" in the building. I told him that if 480 at 2,000 amps shorts, there is a hell fireball. The problem kept happening, and finally to prove my point I baught a bunch of Heathkit Mower Line monitors and set them on the line before and after the service entry. When it happened again, I had the account rep out and showed him the problem. He still claims that they did not have any problems in the system, but since that day our power has been solid.

My nickname for these folks are the "Joe Isuzu's Of Power Companies", because they remind me a lot of the guy who did the commercials, and plays on "Empty Nest". Too bad they just can't admit they made a misteak.

Looks like somebody's wishful thinking again. :-) I'd be curious
to hear who started this rumor!

If I'm not mistaken, the FCC is required to publish a Notice of
Proposed Rulemaking, provide a comment period, a reply to comment
period, etc. before such an action can be taken. The whole idea
of this procedure is so that they can't "pull a fast one"--just
like this one!

Lessee now... what other interesting rumors can we start...

>I'd like to solicit net opinion on the "ideal" antenna for my
>situation

My advice to anyone looking for a simple, efficient, cheap, and almost foolproof allband antenna is the center-fed zepp, which has already been discussed recently in this notes group. Make it any convenient length (preferably at least 1/2 wave on the lowest frequency of interest) and feed it in the center with open wire. Use an L or T network with a balun to match it to 50 ohms. You can build this yourself using a roller inductor and one or two variable capacitors, or spend money on a commercially built tuner.

The commercial 450 ohm ladder line that is available for about $11 per 100' is adequate for just about all applications. It's also easy to make really superior open wire line using #12 wire and lexan or acrylic rod material for spacers.

Ed Gilbert, WA2SRQ

3912. Remote control program to Kenwood TS440, free from iesd.auc.dk

Newsgroup: rec.ham-radio
Date: 1990-12-10 20:02:12 UTC

Message-ID: <1990Dec10.200212.12219@iesd.auc.dk>
Source record: 5806
Cross-posted to: rec.ham-radio,rec.ham-radio.swap,rec.ham-radio.packet

Hello World

Here is again a great program, witch my friend Lars have made. You
can get it by anonymous ftp from:

iesd.auc.dk (130.225.38.4)
username: ftp or anonymous
password: our username..

Filename: tsrem.exe and this text tsrem.txt
path : /pub/ham-radio

Lars is soon going to make a new version of this program, so if you
out there E-mail me inprovement I'am soure Lars will be happy.

God lock and a happy chrismas

Peter Sunesen

GREAT - LOOK HERE - Some news for TS440 owners.

>>> TSRem Copyright (c) 1990 by ARCOSOFT - Lars Rasmussen <<<

TSRem is shareware an may not be used to any commercial purposes.

TSRem is capable of remote controle your TS440 from the PC via
one seriel port (COM1-4). Working all in text mode. No graphics.

On the normal program screen you have the following informations:

Contents of VFO A.
Contents of VFO B.
Contents of a group of 10 M. CH. with a comment to every M.CH.
All the informations in the TS440 display including RX and
TX frequency at the same time.
Mode of modulation.
Steprate 10 Hz - 1 MHz.

TSRem has 2 ways of operation:

1) Status display for TS440 settings. While you control TS440
in the normal way, by twisting knobs and so on, the PC
displays updated info 1 sec. after you have pushed a button.

2) Remote control of TS440. Control the TS440 from the PC's
keyboard. The force of the program.

Memory channels.

You can write a comment of 28 chr. to every memory channel.
Save memory contents to a disk file.
Load disk file into memory.
Print the memory file to the printer on LPT1.

It takes no more than 10 sec. to load or save a file, including
reading or programming the memory in TS440. You can then have
eg. a memory file for every operating mode, 100 memories for
FAX or CW, or 100 memories for every band you will work on.

Furthermore:

Built in scanner. Scans the programmed M.CH. in 3 speeds.
Built in HELP menu.
It's possible to switch between COM1 to COM4 in TSRem.
Selectable IRQ for COM3 and COM4.

At the moment there is no English manual, but thats one of the first
improvements to come.

If yoy find this program of any interrest, please send a donnation to:

I disagree. As long as there is a requirement to learn Morse, we probably
won't see much of this. The big attraction of CB is that you can enjoy much
of the fun of radio without having to know code (or much of anything else,
for that matter).

I do agree on one thing: There will be a lot more people on the bands, making
the CW portions more attractive to those who don't like to fight QRM. Those who
like to chit-chat on SSB are likely to find it more of a challenge if this
"rumor" comes to fruition.

> This is a problem with alt. In one breath you differentiate USEnet
>from alt, and in the next you don't. Be consistent.

My references were extremely consistent. Flagrant mkgrouping is occurring in ALT. alt.swedish-chef.bork^3 is an example of a group that violates the hierarchal structure. No contradicion there, _for the purposes for which the definitions were used_.

> No, read what I wrote. If you do NOT want rec.ham-radio.legal, you
>need do nothing at all. If you do not want rec.radio.ham.legal, you will
>still need to mangle the news feeds to get rec.radio.ham. There is no
>contradiction here.

Wrong. If you want rec.ham-radio.legal, you have to manually mkgroup it, since (by your first statement) people have turned off automake to handle the alt shotgun. Otherwise it'll end up in junk. That was the contradiction.

> In your opinion. Above you say there is no justification for the
>status of ham-radio being at the second level. Here you say there is no
>status. This seems to be a contradiction.

Logical hierarchy and "status" are not necessarily isomorpic. For example, do names that begin with "A" have more status than those that begin with "B"? There IS however a status associated with being archaic, and I'd rather that ham radio wasn't stuck with said status.

> Of all the rec.radio, ham-radio is supposed to be the least
>commercial. Even PBS stations are running adverts these days ("This
>program was funded by ..."). So, we are more noncomm than noncomm. The
>noncomm name fits us better than those who are there now.

The noncomm refers to noncommercial broadcast radio. Read the charter. With the exception of certain legally dubious operations, ham radio is not broadcasting.

Incidentally, PBS is NOT running advertisements. Note that the sponsorship messages don't mention specific products. (One did once and the FCC got very angry, very angry indeed.)

For the vast majority of sites, the name change will involve only editing in the new names and removing the old (and this assumes that the mkgroup hack isn't finished by then). No change in feed will be necessary, as again, the vast majority of sites that receive rec.ham-radio.* also receive rec.radio.*.

I'm sorry, but you've consistently overstated the difficulty in both actions to be taken, and the number of sites that will have to take those actions. I say this having managed several sites (marque, a few ihnnn, shasta) over the past five years or so. I'll be the first one to admit that there are people who have been around here one heck of a lot longer; those that I know of, I've consulted, and they tend to agree with my assessment. That's also the purpose of a CFD.

The split we've proposed took in a number of concerns, the biggest of which was the info-hams mailing list; we split off the legal discussions instead of the technical discussions to better meet the needs of that community. We're currently evaluating some of the other proposals we're seen (the "amateur" mapping seems likely at this point).

3917. Cyrillic morse code

Newsgroup: rec.ham-radio
Date: 1990-12-10 21:25:44 UTC
From: d89mb@efd.lth.se
Message-ID: <1990Dec10.212544.24375@lth.se>
Source record: 5734

Anyone having a CORRECT list of Cyrillic morse code??

In the ARRL handbook I've found a list that just contains pronounciation
"LETTERS" corresponding to each cyrillic letter. Some "errors" is obvious,
or are they not?

The cyrillic "B" is set out at V, but lined up with .-- which is W. Correct?

The cyrillic | | | is set out at J (pronounciation) but lined up with ...-
+-+-+
| | | Is this correct?

The |-O letter is lined up with ..--

The bI combination is set out at the SECOND I, but lined up with a -.--

And What about | | | ? Set out as SHCH, but lined up with Q?
+-+-++
|

Does anybody have any official papers? Or at least references?

Takelr|,

Magnus

THIS is the way to do it! Upload the program to one of the FTP or
E-MAIL reachable sites and then come on here and let the world know
about it. Try to pick a site that has real anonymus ftp or a site
reachable through a listserver, some of us donot have ftp.

Thanks,

Couple of interesting facts: Horowitz is also W1HFA and at one time held the record (he claims :-) as the youngest Ham with a mention in QST (must be in the late '40s or early '50s sometime). He is also the main brain behind Project META, a Planetary Society sponsored search for extraterrestrial intelligence, using one of Harvaarhd's radiotelescopes.

Very practical (and absolutely *crazy* :-) fellow, considering that he is a Physics professor at Harvard and was a by-product of Purcell. One also sees his mug on some NOVA programs, the ones that talk about SETI. In addition to SETI, also known to work on room-temperature detection attempts of the monopole; don't know if he has given up on that yet :-).

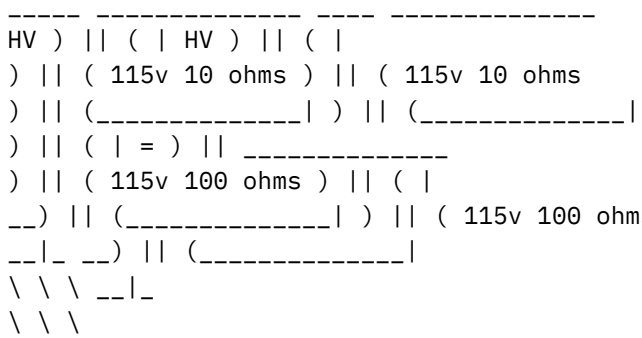
> voltages present on the earth grounds of interior wiring.
> ...

><> Larry Lippman @ Recognition Research Corp., Clarence, New York

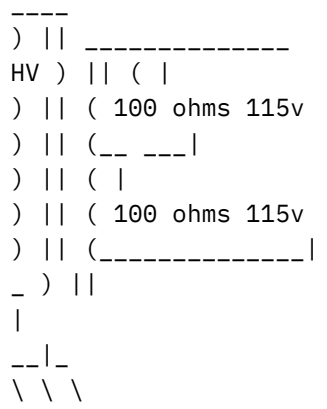
An OPEN NEUTRAL line in house wiring can produce intermittent "power
surges" whose cause may not be immediately obvious:

The Neutral wire is the center tap of the 230-volt pole transformer
secondary winding. As previously posted, neutral and ground wires
should be connected together at only one point.

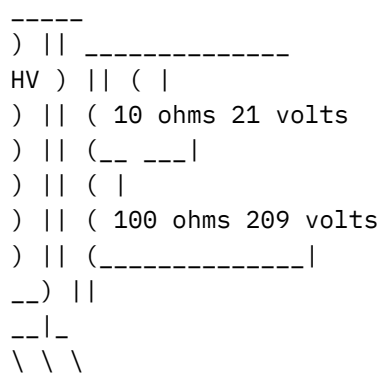
With neutral wire intact, loading on one side of the 230 does not
affect the other half; the 230v looks like two independent 115's:



If the neutral is open or resistive, then loads on opposite sides of
the 230v are in series:



Everything works fine as long as both 115-v legs have equal loads but
if one leg is heavily loaded and the other is not, the 230v will
divide between the high and low resistances according to Ohm's Law.
The high-current device gets too little voltage, and the low-power
device gets TOO MUCH! Both may malfunction or be damaged.



If this happens, a "surge suppressor" is about as useful as a plastic
Jesus on your dashboard! It is a common problem in buildings which
have aluminum wiring.

If the lights get BRIGHTER when the refrigerator starts, or your
computer or stereo blew up when the electric heater came on, suspect
an open or resistive neutral.

> widely understood term among non-hams.

You point out that the term "radio ham" is understood by a growing
majority of non-amateur's. However this doesn't indicate the
connotations many non-operators associate with the term "radio ham".

In my experience, this term has no redeemable value with most
"non-hams". In fact I would argue the connotations are so negative
that we should do anything and everything we can to move to a more
neutral term, and to dispell the negative connotations associated with
Amateur Radio.

I think that the degree of "understanding" the average layman has of
the term "radio ham" is the precise reason why we should adopt the
term "amateur".

I suspect that at one time people would have argued the term "amateur"
had negative connotations. I doubt many sane people would do so now.

=-=

While I'm here, I'd like to also state that I favor the following two names:

rec.radio.amateur.digital (to replace rec.ham-radio.packet)
rec.radio.amateur.regs (instead of r.r.a.legal)

Regarding the rumor that the FCC will eliminate 13- and 20-wpm code tests: if true, this will render moot the entire issue of handicapped code test exemptions for those two speeds. In effect, everyone would qualify for the exemption.

Perhaps this is why the handicapped rules went into place so quickly?

> r.r.a.swap might be better as just rec.radio.swap, since this may encourage
> others with non-amateur-specific yet amateur-related equipment to post
> here as well.

I'm not as sure that much traffic of interest to amateurs
would be generated. There's been about zero traffic in
rec.radio.noncomm about equipment to sell/buy/trade. Of course, with
a specific group for such... I don't think that this will bother
any other rec.radio folks. It won't bother me, at least.

(Declaration of ulterior motive: Many campus radio broadcast
stations are hurting for lack of people with engineering skills. If
the rec.ham-radio groups move into the rec.radio.* heirarchy, possibly
more folks might cross over. Unlikely, at best, but it can't hurt to
try...)

A similar argument could be made for rec.radio.rules as for
rec.radio.swap, but I suspect that the regulations are sufficiently
different that sharing the same newsgroup would only annoy everyone
involved. Rec.radio.noncomm and the BITNET mailing list have had
quite a lot of traffic on indecency/obscenity/safe-harbor, which I
don't think would interest the hams.

From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9012110506.AA23011@cmr.ncsl.nist.gov>
Source record: 5763

A number of people have described the old octal-plugin crystam oven. Be aware that these ovens are of primary benefit over WIDE ambient temperature conditions. The temperature in the oven generally cycles about 1 degree C on a one-minute period. Not exactly the thing for many applications. A proportional oven, with thermistor and analog drive to a heater resistor, and a substantial thermal mass for low-pass thermal filtering. One sometime-overlooked problem is that the heater resistor should be wound "non-inductively" to avoid having it create a substantial magnetic field which can affect crystal frequency slightly (for the purists).

Crystals designed for "room temperature" have a somewhat different freq vs temp curve that "oven" crystals. Oven crystals have a single "turnover" point in the curve, at the temperature of the oven, so the freq vs temp derivative is zero there. Room-temperature crystals have two turnover temps, near the low and high temp ends of the ambient range; they are of opposite sign. The intent is to get the slope between these points as near zero as practical, but it isn't quite perfect. Either design should be suitable for most ham purposes, when in an oven. The hint is that upper zero-derivative point on a room-temp crystal is quite hot, the lower is below room temp.

> the alt shotgun. Otherwise it'll end up in junk. That was the contradiction

Read what I wrote. If you do _NOT_ want rec.ham-radio.legal ... You keep missing the NOT part of the sentence. You are not authorized to drop random words in other peoples arguments just so you can make whatever point you want to make. If you do NOT drop the NOT, there is no contradiction.

If you created .legal in rec.ham-radio, anyone who does not want it has 0 (zero) work to do. No changes in feeds, no changes to active files. This is easy.

If you move rec.ham-radio to rec.radio.ham, and add .legal there, anyone who does NOT want .legal will still be required to make the changes to get rec.radio.ham. This is positive, non-zero effort. You claim it is editing one file. That is demonstrably false. Even so, it is one chance to mess up what is already there.

As the end result, the structure of the ham radio group would be exactly the same IN EITHER CASE. There would be a top level group for general discussion, a swap subgroup, a packet subgroup, and a legal subgroup. This structure would be the same if the group were under rec.radio or directly under rec. The management of growth would be the same. Identical. No difference. Zero (0).

The only difference is in the work required to make the changes to move it all under rec.radio. Since there will be no difference in the results, why go to the effort?

> There IS however a status associated with being archaic, and I'd rather that
> ham radio wasn't stuck with said status.

So the entire argument in support of moving rec.ham-radio is that you don't like hyphens. Let's all mix everything about just to keep Paul from having to see a hyphen.

> The noncomm refers to noncommercial broadcast radio. Read the charter. With
> the exception of certain legally dubious operations, ham radio is not
> broadcasting.

And since this is a reorg, what stops us from changing the charter?
Especially if it leads to a better solution to the problem. You ignored
the ability to do that in your pot-shot post. Amazing, isn't it, but
EVERY idea I used in the alternate proposal was based on arguments
provided by supporters of this one.

And even without a charter change, USEnet is anarchy, remember?

> Incidentally, PBS is NOT running advertisements. Note that the sponsorship
> messages don't mention specific products. (One did once and the FCC got
> very angry, very angry indeed.)

"Jeff Smith's Frugal Gourmet Cookbook is available for $24.95 by
calling 1 800 555-1212." Can't get too much more specific than that, can
you. Have you also noticed that some commercials on commercial TV are
designed with the sole intent of keeping a company name in your mind?
Borden did this for a while. Chrysler, I recall, had a bunch where they
didn't hype any one car, just that Chrysler was back, better than ever.
Infiniti had a series where they didn't even have a car, just seasides and
scenic views -- and the Infiniti logo. No difference from showing me the
XYZ company logo and saying "underwriting provided by...". Or telling me
"... Syracuse China, manufacturer of fine china in Syracuse for 57 years."

And, yes, there was an experiment several years ago, approved by the
FCC, testing adverts on PBS. It was just a few stations. Part of the
fallout, after pressure from PBS's, was that it is now ok to use company
supplied graphics.

> I'm sorry, but you've consistently overstated the difficulty in both actions
> to be taken, and the number of sites that will have to take those actions.

No, I'm sorry, but you've consistantly overstated the benefits of this
change. "No benefit" has been dramatically inflated.

By all means, we need a new subgroup for rule pondering and debating.
Add it. It can be added with NO other changes, with less effort, and with
the same results -- barring the hyphens.

3938. Anybody in New England confirm sarex or voice qso ?

Newsgroup: rec.ham-radio

Except for possibly 1 evening, around 2am, I do not remember the
shuttle get much above 6 degrees elevation in N.E.

I think ? I heard voice during one fo the Saturday night passes..(I
was at a party...1/2 listing to a scanner :)...but
did not copy anything voice or otherwise substantial w/ R7000 and
22 elements pointed on several passess.

I did hear *several* voice and "paketteers" transmitting on
the primary group 1 up-link freq.'s..

Sooooo..is New ENgland got anybody "offical" ... ??

Also, don't forget:

The Student Manual for "The Art of Electronics"
by Thomas C. Hayes & Paul Horowitz ---

It's a spiral-bound workbook (for lab) that contains many
"hands-on" tests to illustrate the text of the "main" book.

All (most) of the diagrams and figures are hand-drawn -- makes it
look more "friendly" and more like a lab book.

Also a great book!

Monte

3940. MAJOR FLARE ALERT & MAGNETIC STORM WARNING

Newsgroup: rec.ham-radio
Date: 1990-12-11 09:19:53 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901211021953.238006e4@HG.ULeth.CA>
Source record: 5691

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 10, 1990

Potential Impact Forecast
--> MAGNETIC STORM WARNING <--
Flare Event Summary

MAJOR ENERGETIC EVENT SUMMARY

At 06:54 UT on 10 December, a major class M5.8/2B flare erupted from Region 6398 at a location of N15W47. This flare was accompanied by strong Type II and Type IV sweeps and weak discrete radio bursts. This flare is a major event and is expected to have a moderate to potentially strong impact with the earth. The estimated shockwave velocity is 1400 km/second, which is easily capable of producing a minor to major geomagnetic storm. The flare was a long-duration event, lasting 103 minutes (1 hour and 43 minutes). It began at 06:54 UT, and reached a peak intensity at 07:54 UT. The event ended at 08:37 UT. A SID/SWF event is strongly suspected of being associated with this flare, although this has not yet been confirmed.

Region 6398 produced the majority of today's energetic events. Along with the today's major flare, it has produced several C-class flares and numerous subflares. This region is a relatively small (540 million square kilometers or 211 million square miles) group with only 15 spots encompassed in the region. It is has a beta-type magnetic configuration, but has a complex magnetic inversion line where the major flare originated. This region is still capable of producing several more M-class events, but is not expected to spawn any other major flares.

No significant proton enhancements were observed throughout the period. This major flare was not a proton flare. Its involvment with strong Types II and IV sweeps, however, indicate that an interplanetary shock is on the way. More on potential impacts will be given below.

Other notes: Old Region 6368 rotated onto the eastern limb today. It has been given a region number of 6412. So far, only two spots have been identified, but it is still too early to see any details. The region currently sports a minor HHX spot configuration, but its accumulated area so far (900 million square kilometers) suggests that this region is still at least moderately large. Early indications seem to suggest that it has decayed into a more stable configuration. More will be known when the rest of the region becomes visible over the next 24 hours.

GEOMAGNETIC STORM WARNING

Today's major class M5.8/2B flare is expected to have at least a moderate impact with the earth. An interplanetary shockwave is expected to reach the earth between 18:00 UT on 11 December and 11:00 UT on 12 December. Geomagnetic activity is expected to reach at least active levels over middle and low latitudes and minor storm levels over higher latitudes. There is, however, a moderate risk that middle latitudes may achieve minor to major storm levels while high latitudes experience mostly major storming. At the present time, the middle-ground is being chosen as most likely. That is, middle latitudes should experience predominantly active levels with some brief periods of minor storming. High latitudes should experience mostly minor storming with brief periods of major storming. More will be known once the impact from this flare begins to impinge on terrestrial activity.

A geomagnetic storm warning has been issued, particularly for the high latitude regions, but encompassing the lower latitudes as well. The magnetic storming is expected to be enhanced somewhat by a favorably positioned coronal hole. The combined effects of the flare and the coronal hole may be sufficient to provide major storm conditions over middle and high latitudes.

The Space Environment Services Center has issued a condition YELLOW alert status for potential PCA activity. The probability for major flares is hovering between 10% and 15% for both class X and proton flares. The probability for further class M-flare activity is steady at 70% for the next 72 hours.

** End of Report **

3941. Temp. control for xtals.

Newsgroup: rec.ham-radio
Date: 1990-12-11 10:18:23 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <11.Dec.90.10
Source record: 5749

I have used a circuit based on a 741 and a thermistor, but, heres the smart part; instead of using the 741 to drive a transistor which controls the power fed to a heating resistor, i used the transistor *as* the heating element! I machined a small 'oven' out of some stainless steel stock, so i had a hollow cube with the internal space about 1.5 inches across, then put the whole oscillator circuit inside. Then bolted the heating-transistor to the outside; (if i remember, it was a TI plastic-power type). The temperature thermistor goes inside the box among the oscillator circuitry. Then stuff the whole thing into a diecast project-box & insulate the space with spun-glass wool. With the temp. regulator adjusted correctly, the xtal stabilised at about 90 +/- 1 degree. Of course, the power fed to the heater is linearly controlled, so you do not get the cycling associated with a traditional bimetal-type thermostat control.

Pete Lucas G6WBJ G6WBJ@GB7SDN.GBR.EU PJML@UK.AC.NWL.IA 0793-411613

3942. CALL FOR REORGANISATION?

Newsgroup: rec.ham-radio
Date: 1990-12-11 10:24:50 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <11.Dec.90.10
Source record: 5748

As an interested observer, i am puzzled at the need for the debate.
If it looks like a duck, it walks like a duck, it swims like a duck, and it quacks like a duck, then it probably IS a duck, and as long as everyone recognises it as such, who cares what it is called?
To those of us outside the Usenet domain, the exact nomenclature of sub-groups (and the resultant debate this seems to produce) seems to be so much hot air.

Pete Lucas G6WBJ G6WBJ@GB7SDN.GBR.EU PJML@UK.AC.NWL.IA 0793-411613

3943. Call for Discussion, pass two: reorganization of rec.ham-radio.*

Newsgroup: rec.ham-radio
Date: 1990-12-11 10:44:15 UTC
From: jmaynard@thesis1.hsch.utexas.edu
Message-ID: <4446@lib.tmc.edu>
Source record: 5739
Cross-posted to: news.groups,rec.ham-radio,rec.ham-radio.packet,rec.ham-radio.swap

There has been much discussion on this subject, and what started out as a simple call for a new group has mushroomed into a complete reorganization of the rec.ham-radio.* hierarchy. This posting reflects my understanding of the current consensus of opinion on the subject, and is intended to serve as the basis for further discussion. I gratefully acknowledge the help of many folks around the net, especially Paul Flaherty, who suggested the original reorganization from which this grew; he and I have discussed this posting, and it carries his approval.

THE CURRENT PROPOSAL:
==========
The following groups are to be renamed:
rec.ham-radio => rec.radio.amateur[.misc]
rec.ham-radio.packet => rec.radio.amateur.packet
rec.ham-radio.swap => rec.radio.swap
Groups will be renamed by creating the replacement group, asking site admins to alias the old group to the new one, and rmgrouping the old group after traffic in it has died down. This method has been shown to work in other hierarchies.

The following groups are to be created:
rec.radio.amateur.legal
This group is intended to contain any and all discussion about legal issues pertaining to amateur radio, including, but not limited to, rules, regulations, laws, and legal actions by and against amateur radio operators. This group is to be unmoderated.

rec.radio.cb
This group is intended to contain discussions related to Citizens' Band radio. This group will be unmoderated.

RATIONALE:
==========
1. Why move the groups at all? The primary motivation is to make it easier for interested people to find newsgroups related to ham radio. The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio before the Great Renaming). It is an inconsistency in the namespace to have groups for similar purposes separated from each other, and that makes it harder for new users to find the desired groups. Further, this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations

attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .legal group? A significant part of the traffic in rec.ham-radio is concerned with legal issues. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .legal, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any legal issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies, but also laws affecting hams (such as the infamous New Jersey scanner law), lawsuits over nuisance issues, antenna ordinances, and the like. .legal is the best description of the intended division of existing traffic I could come up with.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur[.misc]) only, and moving the technical postings off would deprive those on the mailing list.

OPEN ISSUES:
============
1. rec.radio.amateur or rec.radio.amateur.misc? Both have been proposed, and I don't have a strong preference either way. The final proposal will reflect whatever the consensus of the discussion is.

2. rec.radio.amateur.packet or rec.radio.amateur.digital? I do have a preference here, but am willing to change my mind if a consensus is reached that .digital is a better idea.

PLANS:
======
Assuming a consensus is reached by then, I intend to adhere to the schedule I set originally: discussion to run through 31 December, with the vote starting then and running through 21 January. There have been

a couple of other reorganizations in the recent past, and I'll follow the precedent they set in regard to voting: an individual vote is required for each proposed group. In addition, I like Kent Paul Dolan's format for the comp.sys.amiga reorganization vote, and will use it for this vote (though I'll put the ballot at the top of the Call for Votes). I intend to count votes automagically with some sort of Unix-type tool (probably awk); votes that the awk script rejects will either be fixed if their meaning is unambiguous, or returned with a request for clarification if not. Other than that, votes will be acknowledged en masse about halfway through the voting period, and not by mail. Votes will be sent to this site, and probably to my account here. (Don't send me votes yet; I can't accept them.)

It looks like we can bring this to a successful conclusion, especiallly if everyone maintains the same high standard of calm, reasoned discussion that's been shown so far. Please post any discussion to news.groups as well as rec.ham-radio, as per the guidelines.

3944. INFO PLEASE -- PC S/W for SSTV

Newsgroup: rec.ham-radio
Date: 1990-12-11 11:16:41 UTC
From: rsmith@axion.bt.co.uk
Message-ID: <1990Dec11.111641.20876@axion.bt.co.uk>
Source record: 5740

Hi there

I am posting this for a friend, G7EIG who does not have access to
the net. I have no knowledge of the subject, so please excuse
any mistakes, blunders etc.

Can anyone supply information on the possible sources of PD S/W for
SSTV programs for a PC.

Modes required are:
8sec. B/W
12sec. B/W
32sec. B/W ?? Colour
92sec. Colour

Any information gratefully received with regards to sources, including
a brief description on how to access (I read a lot but nil access to
sources). Alternately please email direct to me.

Time permitting I will sumarise the info received.

Thanks for your time in reading this plea for help, Colin I hope you
appreciate this.

Good DX to you all.

3945. ft-470 cloning?

Newsgroup: rec.ham-radio
Date: 1990-12-11 13:03:35 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9012111303.AA03979@lonexc.radc.af.mil>
Source record: 5752

I would like to play around with cloning my ft-470 and i was wondering if anybody out there is currently doing this. if so what format is the data extracted in. as i understand it you put the ft-470 in clone mode by turning it off, turning it on with the f button depressed. all the segments on the display will be on. to unload the data press the up arrow and to download press the down arrow. the data "comes out" of the microphone tip (i believe).

I know that I have seen postings here re the ft411 and cloning and how you can edit tx and rx frequencies frequencies and down load them back into the rig.

Which processor straps must be activated for this operation.

Is a memory map available.

please answer me here and I will compile the results and post it.

thanks.
buzz
wm1w

p.s. yes i am a ham and i do not tx out of band. an ht is simply a very good rf frequency generator that has many uses if i could get just a bit more range out of both the 2m and 70cm sides of the rig. tnx

3946. Re: FCC Rumor -- (But what if it is true?)

Newsgroup: rec.ham-radio

Source record: 5695

I'm wondering what the FCC considers as covering what for NPRMs. About a year ago there was an FCC report (I have a copy at home on my AT somewhere) that among other things, recommended that all testing to be fair should have a direct relationship to privlidges granted. While the Novice enhancement removes a gross unfairness in the light of that document by making the TECH license easier, there still are a LOT of original pre-enhancement TECHs out there but at 5wpm. The only thing keeping them from GENERAL privlidges was the increase in code speed. Since there is a LOT of license enhancement from TECH to GENERAL in phone and other privlidges the code test for only a small increase in code privlidges coupled to that might be the target for change.

It really depends on what the FCC REALLY does, not what is rumored.

Photo Radar is NOT in the K or X band, but in hte Ka band, where these restrictions do not apply. I'm not sure if they never applied there, or if there was a special exemption for these types of equipment.

HOWEVER, I would appeal photo radar on totally different grounds. How can you confront your accuser in court when there was absolutely NO HUMAN INTERACTION at all? Totally unconstitutional, IMHO.

Someone was asking about this; the diagram attached should explain the
usuall commercial antenna installation practice.

```
! ! ! !! !
! ! ! !! !
! ! ! !! ! RIGHT! Mast extends through the
==========================++======== field of the antenna and so the
! ! ! !! ! symmetry is preserved.
! ! ! !! !
! ! ! !! !
!!
!!
!!
----
! !
! !

! ! ! !
WRONG; Stub-mast is ! ! ! !
not mounted symmetrically ! ! ! !
with respect to the field ==========================++======
of the antenna and will ! ! ! !! !
distort the polar diagram. ! ! ! !! !
! ! ! !! !
!!
!!
!!
```

Of course, if you can get a non-metallic stub-mast, so much the better.
Fibreglass windsurfer masts can be used here; the slight flexibility
may make the difference between your antenna surviving high winds, and
finding a tangled heap of tubing in the back yard one morning....

3950. "True" RMS AC Voltmeters

Newsgroup: rec.ham-radio
Date: 1990-12-11 16:07:46 UTC
From: chris@hplvec.LVLD.HP.COM
Message-ID: <2190004@hplvec.LVLD.HP.COM>
Source record: 5744

A recent discussion of digital voltmeters discussed the topic
of RMS, and "True" RMS AC voltmeters. I looked into this a bit
and I think the following will clarify the situation.

There are many ways to measure AC voltage, some are more accurate
than others.
1. One can rectify the waveform and integrate, but this does not
yield RMS, but average voltage. A mathematical correction takes
you from average to RMS, which is OK if your waveform is truly
sinusoidal.
2. "True" RMS refers to a more refined technique in which a RMS
circuit (usually in an IC, these days) actually produces a
voltage proportional to the Root Mean Square. This is a somewhat
complicated analog circuit, but is more accurate than method
number one, which is an approximation from average voltage.
3. With today's fast digital multimeters, it is actually possible
to digitize the waveform (up to some limiting frequency) and
then compute the root mean square. This is again "true" RMS.

The term "True RMS" may seem a misnomer, but it corrects the
use of the term "RMS" for techniques which did not always
yield RMS at all, but actually measured average, and applied
a correction factor.

>they could not communicate - someone had an antenna pointed in the wrong
>direction (the report did not say whom).

There was no attempted amateur radio contact with the Mir on Dec 4th,
the Soviets said they would be too busy with docking and unloading to
schedule a contact.

Perhaps Musa was trying anyway, unfortunately Ron was not operating
at the time. If so they may have assumed an antenna pointing problem.

There was a contact scheduled for the next close conjunction which would
have occurred today (Tues 12/11/90) but since they landed last night,
that won't take place :-(

3952. ARRL 10M Contest

Newsgroup: rec.ham-radio
Date: 1990-12-11 16:21:38 UTC
From: pescatore_jt%ncsd.dnet@GTE.COM
Message-ID: <9012111621.AA00190@bunny.gte.com>
Source record: 5776

I operated at W3USS this past weekend in the 10 meter contest. It was only myself and K3ZJ, and I only was there Saturday afternoon and early evening, but we had a blast. Ended up with about 2250 QSOs, about 1700 or so on SSB since Dave is not a CW op. Not sure of the multipliers yet, since Dave was using the CT logging program, rather than the NA program which is much better for the 10 meter contest.

W3USS is the club station of the Capitol Hill Amateur Radio Society, and is maintained thru the sweat and efforts of current and past Senate employees. It was in its hay-day (sp?) when Barry Goldwater was still around, in fact he had a rig in his office and a switch where he could preempt the antennas from the club station in the basement. The setup was K3ZJ's FT-1000 (great radio), Dentron amp, and a TH6 on a 40 foot tower on the roof of the Senate office building, which means the antenna is at about 150'. The roof is copper plated but the tribander still seems to play real well. An old IBM 3270-like, XT predecessor was used as the logging computer, which is strange because it has a totally non-standard keyboard. Anyone I worked on CW, I apologize if I sent QRL QSY instead of TU!

W3USS is located in the District of Columbia, which counts as a seperate multiplier in the ARRL DX and 10M contests. Any of you who worked it and would like a QSL, QSL via W4WG. USS returns QSLs 100%.

Band conditions were good here, not sizzling like a few years ago, but we had an average rate of over 85/hour we were on. Nice DX: JD1, NH2, AH3, VR6. JA activity seemed down from previous years, mayber they are all working weekends getting HDTV to market.

>on each pass. Anyone who knows for sure, please let me know what's going on.

A new number is assigned for each connect, but it doesn't go into the
"confirmed" log if it is a dupe. And if you don't ack the QSL and
disconnect packets it is not counted as confirmed.

>Aloha, hope everyone that tried managed to get through to STS-35!

I got connected but then downlink became too noisy to copy my QSO number,
another local station copied it (#667) but it won't be in the confirmed
log since I didn't receive and ack the QSL and disconnect. Oh well.

3954. Re: FCC Rumour

Newsgroup: rec.ham-radio
Date: 1990-12-11 16:51:34 UTC
From: enders@plains.NoDak.edu
Message-ID: <7102@plains.NoDak.edu>
Source record: 5699

You know, the old FCC just might do something like this, considering the ARRL's lawsuit over 220, just out of sheer oneryness. It could be the best thing to happen to ham radio in years, provided that they replace the defunct elements 1B and 1C with a more rigorous set of theory elements.

A possible scenario would go something like this:

1. FCC eliminates elements 1B and 1C. Pre-"novice enhancement" technician licensees are grandfathered to general, having had passed old element 3 (now 3A and 3B).

2. Exam elements 3B, 4A, and 4B are revised to place greater emphasis on theory, rules & regs, etc. This provides a graduated upgrade path on the basis of technical skill and knowledge. All upgrades are based on the 'improved' theory elements.

I have a feeling that the OFN will fight this like the plague. (OFN = Old Fart Network :-). I think that eventually we might see only three license classes:

1. No code VHF only: 6 meters and up, full privledges.

2. Novice type license: 5 wpm CW, limited HF privledges (but expanded from what they are now), limited power (250W max), limited VHF privledges (6m, 220, 440, 1296, 2304 MHz bands, restricted at least 1 MHZ away from weak signal subbands).

3. Full amateur license: 5 wpm CW, all HF and VHF privledges.

3955. Call for Discussion, pass two: reorganization of rec.ham-radio.*

Newsgroup: rec.ham-radio
Date: 1990-12-11 17:02:27 UTC
From: jmaynard@thesis1.hsch.utexas.edu
Message-ID: <4449@lib.tmc.edu>
Source record: 5687
Cross-posted to: news.groups,rec.ham-radio,rec.ham-radio.packet,rec.ham-radio.swap

(Apologies if this gets posted twice; I haven't seen the first one appear,
and it's been 6 hours since I posted it...)

There has been much discussion on this subject, and what started out
as a simple call for a new group has mushroomed into a complete
reorganization of the rec.ham-radio.* hierarchy. This posting reflects
my understanding of the current consensus of opinion on the subject,
and is intended to serve as the basis for further discussion. I
gratefully acknowledge the help of many folks around the net,
especially Paul Flaherty, who suggested the original reorganization
from which this grew; he and I have discussed this posting, and it
carries his approval.

THE CURRENT PROPOSAL:
=====================
The following groups are to be renamed:
rec.ham-radio => rec.radio.amateur[.misc]
rec.ham-radio.packet => rec.radio.amateur.packet
rec.ham-radio.swap => rec.radio.swap
Groups will be renamed by creating the replacement group, asking site
admins to alias the old group to the new one, and rmgrouping the old
group after traffic in it has died down. This method has been shown to
work in other hierarchies.

The following groups are to be created:
rec.radio.amateur.legal
This group is intended to contain any and all discussion about legal
issues pertaining to amateur radio, including, but not limited to,
rules, regulations, laws, and legal actions by and against amateur
radio operators. This group is to be unmoderated.

rec.radio.cb
This group is intended to contain discussions related to Citizens'
Band radio. This group will be unmoderated.

RATIONALE:
==========
1. Why move the groups at all? The primary motivation is to make it
easier for interested people to find newsgroups related to ham radio.
The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio
before the Great Renaming). It is an inconsistency in the namespace to
have groups for similar purposes separated from each other, and that
makes it harder for new users to find the desired groups. Further,
this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .legal group? A significant part of the traffic in rec.ham-radio is concerned with legal issues. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .legal, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any legal issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies, but also laws affecting hams (such as the infamous New Jersey scanner law), lawsuits over nuisance issues, antenna ordinances, and the like. .legal is the best description of the intended division of existing traffic I could come up with.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur[.misc]) only, and moving the technical postings off would deprive those on the mailing list.

OPEN ISSUES:
============
1. rec.radio.amateur or rec.radio.amateur.misc? Both have been proposed, and I don't have a strong preference either way. The final proposal will reflect whatever the consensus of the discussion is.

2. rec.radio.amateur.packet or rec.radio.amateur.digital? I do have a preference here, but am willing to change my mind if a consensus is reached that .digital is a better idea.

PLANS:
======
Assuming a consensus is reached by then, I intend to adhere to the

schedule I set originally: discussion to run through 31 December, with the vote starting then and running through 21 January. There have been a couple of other reorganizations in the recent past, and I'll follow the precedent they set in regard to voting: an individual vote is required for each proposed group. In addition, I like Kent Paul Dolan's format for the comp.sys.amiga reorganization vote, and will use it for this vote (though I'll put the ballot at the top of the Call for Votes). I intend to count votes automagically with some sort of Unix-type tool (probably awk); votes that the awk script rejects will either be fixed if their meaning is unambiguous, or returned with a request for clarification if not. Other than that, votes will be acknowledged en masse about halfway through the voting period, and not by mail. Votes will be sent to this site, and probably to my account here. (Don't send me votes yet; I can't accept them.)

It looks like we can bring this to a successful conclusion, especiallly if everyone maintains the same high standard of calm, reasoned discussion that's been shown so far. Please post any discussion to news.groups as well as rec.ham-radio, as per the guidelines.

Yes, but there are a lot of old Techs out there (like my wife - KA3NQD and my father - KA3ILE.) Sure hope all the rest of you kept your original Tech license. It's the only way to prove which test you took. The FCC database only lists the last time you changed, not the original test date.

Interestingly enough, there was a write-up on this subject in the
December QST. Al is quite right that it is QUITE illegal for reverse
patches to be caused by anyone but a licensed operator. About the
only way to hook a phone up to a repeater that non-hams can use is to
use it as a voice mail box. The caller can deposit the message into
the machine and it gets replayed ONLY when a ham on the air asks the
repeater if he has any messages. It probably isn't even proper for
the repeater to go into some sort of beacon mode saying it has messages
waiting(this being equivalent to the repeater turning on as the call comes
in...)

Source record: 5698

Throwing my own two sparks into the fray, here's what I'd like to see:

rec.radio.amateur

Discussions about amateur radio, e.g. technical *and/or* legal.

A large percentage of any legal discussions will be technically
based. It will be hopelessly confusing to separate the two
and will result in endless cross postings. Since we as hams are
supposed to be using minimum power necessary to communicate, we
should not create a .legal group.

rec.radio.amateur.qst

Announcements only for special events, AMSAT, shuttle, prediction
bulletins, etc. These are important for everyone and should not
be buried in the discussions.

rec.radio.amateur.packet

Same as before.

rec.radio.amateur.swap

Same as before.

I am in need of accessories for the TS520S.
In particular, I need the 12volt power cord(or just the plug) and a mic
that went with it or will fit it. I also would be interested in any
other accessories at the right price.

3962. Utility Monitoring Database in DBASE III+ (?????)

Newsgroup: rec.ham-radio
Date: 1990-12-11 19:01:26 UTC
From: flash@lopez.UUCP
Message-ID: <1990Dec11.190126.3725@lopez.UUCP>
Source record: 5755
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Now that I have a PC in my radio room, I have been having fun setting up various systems to aid in monitoring.

I already have a scanner database for maintaining all the data on local transmitters audible on my PRO-2004.

Well I got to thinking how nifty it would be to have a HUGE UTILITY database of the entire shortwave spectrum. Sort of an online version of some of the books out there (like Grove's shortwave book). One that I could update with my own monitoring info.

I was starting to write the code to maintain the database, lay out the entry and report screens, etc., when I got to thinking....

AM I RE INVENTING THE WHEEL? Surely someone out there in Netland is as much a Utility Nut as I am and has already not only written the software but also has already typed in several thousand entries.

Or not?

I do have such a database that a friend made in PCFILE, but I really would prefer to have it in DBASE III+, since you can make much greater use of the information.

It would be nifty to tune to a frequency, hear an unid'ed signal, and type the freq in and find out who it is. Lots nicer than looking it up in a directory.

Before I begin the monumental task, I thought it would be at least worth a shot in seeing if anyone else out there has started a similar project. Perhaps we could combine efforts.

If responses are negative, I might try converting the PCFILE one to DBASE III+, and will eventually make it available to those interested.

Is such a thing on SIMTEL 20 or elsewhere?

It is a nice cold snowy day up here, the perfect kind of day for such a project.....

>the "Mr. Microphone" type toys that are sold. Exactly what is the law
>concerning FM transmissions, and where might I find the text of that
>law without having to go through every piece of legislation that the
>FCC is involved with? ...

It's in Part 15 of the FCC Regulations, available from the Government
Printing Office in DC. Briefly, in a number of frequency bands
(including the FM broadcast band), unlicensed transmitters are legal
so long as they don't cause interference to the allocated users of
the band and as long as they meet certain technical requirements.
As I recall, you can either 1) limit power to 100 mW and keep the
antenna below a certain size, or 2) keep the radiated field strength
below a specified microvolts per meter.

>Seems to me there should be no interference between the two yagis. But
>for the 2m yagi i suddenly have the rotor pole in the same plane as the
>2m yagi. So what will the rotor pole do to the 2m yagi?

Three possible solutions:

1) Use an insulated mast (broomstick handle, etc.) to the 2M yagi, and
run the feedline off the back of the beam (behind the reflector) so that
there is no vertically-polarized metal in the middle of the antenna.

2) Mount the 2M yagi in front of the mast, that is, sticking out from
the mast in one direction only. This will mechanically unbalance the system,
so you might want to use a counterweight.

3) Just go ahead and run the aluminum mast up through the middle of the
yagi. If the mast and other metal structure don't happen to be
resonant near the 2 meter band, this often works surprisingly well.

Hi, Scott. Long time no hear!

I have used rustoleum on the joints and hardware with good success.
The antenna does look kind of odd with patches of grey primer, but once
it's up in the air, it's not too noticeable. I have even considered
painting the whole thing with grey primer, overpainted with splotches
of robin's-egg blue to camouflage it like a WW-II Spitfire!

Whether it's 'progress' or not is truly beside the point. "Ham Radio" is our traditional pet name for our hobby, and changing our hobby, especially changing its name, to fit the needs of an external medium we use to discuss it is to let the tail wag the dog. Sure we could do that, but the only ones who would want to are the ones whose hobby is 'newsgrouping' rather than 'hamming'.

Law: If it ain't broke, don't fix it.

Corollary: Even if it's broke, I like it that way.

I always recommend new hams start with a used rig. It's plenty good enough to get your feet wet. After you've had some on-the-air experience, you will have decided what features are important to you, so that when you do buy a new radio, you have a better chance of getting what you want. You should then be able to sell the used radio for nearly what you paid for it (since you bought it used.)

I was away from home from Saturday afternoon until Sunday night
this weekend, but I left my packet station on 145.55 recording
all frames on the channel.

I'm not sure what time it was when I received them, but, when
I returned Sunday night, I'd received a bunch of frames from
WA4SIR ack'ing a number of ground stations. The station was a TR-2600A
with a 1/4 wave ground plane up about 8 feet (temporary setup).

My brother sez he monitored WA4SIR talking voice with his Realistic
scanner, nothing but a whip antenna on that.

Last night, at 9:50PM locally, I was standing in my back yard
in Lancaster (maybe 15-20 miles from Edwards) and was treated to
the LOUDEST set of sonic booms I've ever heard (and, living near
Edwards, we get house-shaking booms almost everyday). These were
louder than the SR-71 when it passed over LA earlier this year,
and these were louder than I've ever heard the shuttle before.
The glass in my sliding glass door flexed in and out. I could
hear a thundering, rushing noise for sometime afterwards, also,
I suspect the windnoise from the shuttle.

I love living near Edwards.

Why say UGH? CB out of the cities is a useful and fun personal communications
system. Which is exactly what it's meant to be.

>2510 doesn't have. I'd like to hear from owners of all three radios
>(and any I've missed) on their likes/dislikes.

I have a 2510 and it's been converted to receive CB. I suppose it'll
transmit there also if ever needed. It gives be both 10 and CB in a
single box which is fantastic. Anything that reduces the number of wires
and antennas really helps. (I didn't have any trouble with the number
of radios until I started running packet mobile - :-)

The Radio Shack rig is similar but doesn't have AM. That won't help you
on channel 19 where all the trucks and other road traffic is.

I haven't had any experiece with the 2600.

>
>Also, someone posted an article on how to make your modified ham rig

>microphones and other things. I would appreciate a copy of that
>information if someone has kept it. (My goal is to keep a low profile
>if I do choose to modify a ham rig.)

The 2510 does have a hi/low modulation switch. Using low modulation and an antenna tuned for 10 (bad match on CB) you'll have a signal that won't be much different from a well tuned up CB set. Sorry, but I didn't keep the prior posting describing CB radios.

>
>[Aye Captain, shields on high]
>

The best option, as was rudely put in another response, is to upgrade. With access to all the ham bands you'll have no end to the folks to visit with.

Another option, which could actually help you upgrade, is perfectly legal and lots of fun. You already have CW privileges on 80, 40 and 15, of which 80 and 40 will both be open most of the night. Why not try CW? You'll be on the air, the miles will pass faster and your code speed will increase. Even better, a mobile CW signal will work much better than a SSB signal for the same power due to the lousy mobile antenna systems.

Also, while it's possible to modify a ham rig for CB use, the reverse is both possible and legal. The addition of some extra crystals or other frequency generation magic will put a CB on 10. Thus giving you a single rig that works for both bands. Some folks may say that a CB set with added frequency range is no longer legal on CB - but, if done carefully, it sure isn't going to hurt anything.

Good luck. Let us know what you come up with and how the holiday drives across Texas turn out. This year my folks from Montana are coming down to visit me in Colorado - so no Wyoming star gazing trip this winter for me.

>amateur radio operator.

I've seen the exact opposite argument in QST, suggesting that we use the
term "HAM" because people have a better recognition of who we are when
we say "HAM" rather than "amateur". QST said that many people equate
an amateur radio operator with a pirate radio station. They're not a
PROFESSIONAL radio station, right? So they're AMATEURs and therefore
a Pirate.

Oh, well.

>
> John, I have to ask how can a logical person say that a name change to
> better describe this group to tens of thousands of sites worldwide is not
> progress?

I see. Ham-radio is a rather specific term, which is probably pretty
well known worldwide. Amateur is a generic english word, which means, as a
first approximation, 'not professional'. Since dictionaries seem to mean
'final arbiter of all' to you, here are quotes, from The Living Webster:

"Amateur: One who cultivates any art or pursuit for the enjoyment of
it, instead of professionally or for gain, sometimes implying desultory
action or crude results." There is no mention of radio in this definition.

"Ham: (under a section of the definition labelled 'radio') a licensed
operator of an amateur radio station."

So, ham when applied to radio specifically determines the subject.
Amateur when applied to radio implies ANY non-professional activity
including radio.

Keep in mind, I am reading this as someone who does not know what ham
radio is, does not know English, and looks every new word up, which is the
basis for your claim for the change being good. Only those worldwide
beings who do not know what ham-radio is would benefit from the name
change. Sadly, if they don't know either ham or amateur, the dictionary
does not define radio.amateur as well as it does ham-radio, and they will
not benefit. They lose. This is a step backward.

Not an unreasonable occurence: "Hey, I run a pirate station in Greece,
but I don't do it professionally. I am an amateur user of radio, but I am
not a licensed amateur radio operator. If I saw radio.amateur and looked
it up I would guess I fit in. If I saw ham-radio, and looked it up, I
would know I don't."

Oh, then read the charter. That will clear things up. Well, the
current charter clears things up, too. So, if reading the charter is the
primary way of identifying groups, there is no reason to change.

> Merriam-Webster defines real as: Authentic, genuine, actual and true.
> Progress is defined as: To develop a higher, better or more advanced stage.
> How can you state that it is not progress of ANY kind? Are your criteria

> different than that of the international dictionary? If so, why?

Which section of your dictionary defines the name change of rec.ham-radio as a higher, better, or more advanced stage? I happen to use the same definition of progress as Mr. Webster. I just realize that the name change is not a higher, better, or more advanced stage. It is just different. Since it is not a h, b, or mas, it is not progress. That is how I can say it is not progress of ANY kind. A chickadee is not a cat, so I can say a chickadee is not ANY kind of cat.

And, as Mr. Webster has shown above, renaming will actually broaden the definition of the group instead of clarifying it. This is a step backward.

> > Since there was an affirmative reply to the post of one site against
> >it, then there are obviously TWO sites. If there are TWO, then there are
> >probably more.
>
> Maybe not, and if so, so what? The majority consensus will prevail as define
> in the net rules established for creation of new groups. Two sites MAY be 2
> no votes if they even take the time to vote.

That comment was in the context of a claim that I was the only objector. I pointed out that that statement was false. It shows the trend in the arguments of the proposal supporters to make proveably false statements. You have not proven it was true, so you argue into the wind. It goes with the provably false argument that this change would involve editing only one file.

> Since you obviously are not up to speed on group creation, removal etc, a
> short education is in order for you. Many sites have AUTOMATIC new group
> creation enabled. Those that do not, require a simple intervention by the
> news administrator.

Not all sites require a simple intervention. You make unwarranted assumptions about the world. For someone at an easy site to claim that it is easy everywhere is an insult to those who are at the difficult site.

> I am the news administrator at this site, so don't
> try to snow me with how difficult this all is!

You are an admin at an easy site. I am an admin at a difficult site. Don't try to 'educate' me as to how easy it is, cause it ain't. The only snow here is from those who have easy sites and don't like hyphens.

> > The only real change is the addition of a .rules or .legal subgroup,
> >which could be done WITHOUT any other name change.
>
> Wrong. See defininition of "real" above.

My entire statement is correct. Moving an entire tree enmass from one parent to another involves no change in the tree. This name change is exactly like mv'ing a directory that has subdirectories from one parent to another. Nothing in the children changes. Only the full path changes,

but if you have trouble with files being in two children at the same
time, mv'ing the parent directory will not fix that.

> Sure it COULD be done without any other changes.
> If you are not going to change something with the goal to make it as near
> perfect as something man-made can be, why bother at all?

You are saying the renaming rec.ham-radio will make it as near perfect
as something man-made can be? Then those who took part in the Great Reorg,
who created rec.ham-radio, did not do their best? Of all the problems
people are having with ham-radio, this solves NONE of them, and makes it
less specific from the name what the group is about. Take two steps back.

> Do you approach all your projects with an attitude of why bother to do my bes

That is just silly. Claiming that renaming rec.ham-radio is the best
is just silly. It is one of those unsupportable, unsupported allegations
that keep getting tossed into the discussion.

> > Your post is yet another wild claim of perceived benefit with no

> The JUSTIFICATION was stated at the beginning of the reply as well as by
> numerous other posts on this subject. The only wild claims were made in
> your emotional original post and reply.

I did not make the original post. Are you sure I am who you think I
am?

The only justification given has been that 1) it makes the name
better, and 2) it makes the name less archaic.

1) was pretty well shot down by Mr. Webster. 2) is a personal opinion,
and has not been justified. Archaic is not bad, per se. "Ham-radio" (as a
hyphenated word) does not match any of the bad definitions of archaic.

> I've seen some negative posts in the last 4 years in this group.

Did you see the reply form Paul to my alternative proposal? That was
pretty negative, and certainly more negative than anything I have posted.
I keep asking for the reasons for the change, and I keep getting the same
unsupported claims and subjective analyses of how bad the name is. Nobody
can supply a reason that makes the effort worthwhile. I took those same
unsupported claims and generated a better proposal, one that included
groups for other amateur users of the spectrum (some that were explicitly
asked for in responses to the CALL but were ignored by the original
authors), and specified the name better, and got a two line pot shot in
return. That is being negative.

> You should be proud to be right up there with the worst of them, providing
> NO rational basis for your claims.

I was making the assumption that those I was talking with were cognizant enough to realize that the whole world is not C news and UNIX, and that some sites are more difficult to manage than others. That they realized that 'difficult' and 'hard' are highly subjective terms, and that what they perceive as easy is not easy for everyone. That different procedures that achieve the same results at different places are not necessarily all equivalent as to difficulty. That, perhaps, one person saying 'this is not easy' would gently remind them of these facts, without having to provide crossed-t's and dotted-i's and counts and statistics and ad nauseum.

However, I see this belief is unjustified.

Not every site in the world runs UNIX and C News. There are alot of VMS sites. There are alot of IBM VM/CMS sites. There are a lot of Xenix sites. There are alot of PC sites. There are alot of 'you name them' sites, that are not UNIX and not C news.

Not every site in the world feeds everything. Some sites take only what they want. Some just physically couldn't handle the load. Some have management limitations (cf. the recent post re: sci.ham-radio in news.groups) that prevent full feeds. Some are allowing news as long as it takes no work to maintain, or on a tentative footing (cf: the post from the gentleman from the University who is in this situation). Most sites provide feeds to others on a free basis. That means that any changes requested by the feed fall at the bottom of the stack.

'Hard' and 'easy' are subjective terms. That means what is hard is very much dependent on who is doing it. What is easy for you may be hard for others. If this were not true, then we would all be UNIX gurus, and make millions playing professional sports. A friend of mine is struggling with an HP printer. I could set her up in about 5 minutes, but this is for work and I don't work there. It is hard for her. If I said 'oh, that is easy', that would be rude and insulting.

Since not every site in the world is the same, they don't all do the same things in the same way. Some of the equivalent procedures may be easy at your site, and not easy at another. Compare this with computer languages. Complex arithmetic in FORTRAN is easy. Complex arithmetic in C is not so easy. Both come out with the same results.

> You are guilty of the very same error
> you accuse me and others of making.

You are guilty of ignoring the variance in the world. I am guilty of assuming you would know there WAS variance.

> This is an extremely inaccurate analogy.

It is extremely accurate. Renaming rec.ham-radio will obscure the fact that it is for ham radio, just like rec.radio.noncomm seems to mean ANY noncommercial radio. Renaming NYC to SBN will hide the fact that it is in NY. Renaming r.h will not fix the problems with cross posts, or anything else. Renaming NYC will not fix the roads or the potholes or the crime.

In both cases, you wind up with the same thing under another name.

> I never claimed that the name
> change would provide a solution to this groups problems. Maybe next time

<<important plot element follows>>

If the change does not provide a solution to this group's problems, then
WHY DO IT? If it ain't broke, don't fix it. Change for change' sake is
not progress, it is chaos.

> you should spend as much time reading as you do wasting bandwith with
> inaccurate analogys, erroneous and inflamatory claims.

I would suggest that you think about what I write, and perhaps you
will catch the analogies and understand the claims the first time,
instead of making me dot all the i's and waste all the precious
bandwidth explaining everything twice.

Not all groups deal with ham radio.

Universities, in particular, have shown increasing concern about
providing USEnet news to their students/staff. They are concerned about
free speech issues and liability for racist or sexist remarks made in
news systems they run. The admins are concerned about the net.flamage
that a student/staff member can generate by posting things in poor taste.
The PSU admin did not escape the flames when his site was guessed to be
the source of a BIFF post. The admin of the site that sourced an explicit
description of sex between the crew of the Enterprise is probably less
than happy that his site has USEnet.

If you worry about these things, the easiest thing to do is not carry
ANY news.

One problem with the ham community today is that people who do not like CW have already been filtered out.

Imagine what the ham community would be like if you had to operate SSTV in order to be a ham. SSTV would be more popular than it deserved to be, and it would tend to become a sacred cow.

So also Morse Code.

Your goals and requirements are reasonable. Get on 10 phone as soon as you
can. With the excellent band conditions lately - these are going to
be the good-old-days that we'll all be talking about for years to come. But
definately don't forget CW. When 10 dies, as it does here at sunset, move
on to 15, 40 and 80. You'll find a whole world of new interesting friends to
visit with. And in a couple months you'll be ready for the General/Advanced
code test.

>

Which brand and type rig is a religous issue. You'll always be able to find
someone that thinks rig A is the greatest and rig B is foo while the next person
thinks the opposite. Look at them all. List the features. Find some local
ham or club and play with their radios. Better to wait a little now and find
one you really like. Some rigs to try include the ICOM 735 and 725, Kenwoods
TS140 or TS440. Yaesu also makes similar rigs but I'm not familar with the
numbers.

> I think my personal preference would be an LCD display for the frequency, but
> I am told that it is sometimes better to get an analog tune.

Yes. You want a digital display (LCD). Older rigs had analog displays. Some folks may like analog better. Try them both first for yourself.

Since you're into computers and gadgets I suggest a MUST requirement for your new radio be "computer" control. Most new rigs do this.

Re: Rigs

I'd recommend a pass thru someone's back issues of QST magazine for
product reviews. Some of the glitches they find might be serious.

Also of note, one of the Ten-Tec high-end rigs is a ham-only rig in order
to eliminate synthesizer phase noise. (I forget the rig name.)

Don't let your head be turned by all the "stuff" on the high-end
rigs. Most of it is for fairly specialized situations such as
contesting.

I have yet to figure out what "professional grade" means when
applied to "amateur" radio equipment.......

In <sifakis@sono.uucp (George Sifakis)> George asks:

>Can I measure real (not relative) Watts using a Heath Cantenna dummy
>load? The thing provides a circuit with a divider (100K in series,
>100 to the ground) plus a rectifying diode in series. How can I read
>a voltmeter connected to that circuit?
>

Let's see-- P equals E squared over R. R is 50 ohms which is the dummy load. An RF voltage is impressed across this R and we can rectify this voltage. This becomes E. We impress E across the two 100K ohm resistors in series, and read the voltage (let's call it X) at the junction of the two (have I correctly identified the circuit?)

To determine P, then, we take X and multiply it by 2 (to get E), square this value, then divide by 50. A 100-watt RF source should give a voltage reading at X of 35.35 volts. To read the power directly in watts, you need a meter with a scale calibrated to the formula.

The meter should connect between the junction and ground, and should have an input impedance of at least a megohm.

Due to the large number of USENET sites and potential voters
at Universities and other places with long holiday breaks, you might
want to consider delaying the vote slightly to ensure that all
interested parties have an opportunity to vote. If the vote doesn't
start until it is posted in news.announce.newgroups, it might be
actually be held 6 January through 27 January, which should be enough
delay for almost everyone concerned.

>>you copy?
>>
>I note that lots of exchanges include the HW CPY? on each call. Does this
>question refer to another signal report or an inquiry as to how much of the
>transmission did the other fellow get?

It may be either, or even both. When both ops have reported good signals, say, 599, it probably isn't necessary. Usually, weak signals, QSB, or QRM/N may cause one or both ops to wonder if conditions have changed enough at the other end to cause problems. Or, you may have rotated your antenna to get a better "bead" on the other station and ask. An op may wonder if he (she) is sending too fast (or too slow). I use HW CPY? at the first exchange, and HW NW? occasionally during the ensuing exchanges according to conditions.

It is easy to slip into a habit, and I suspect that many ops just send it out of habit. (It keeps your "Y" sending in practice, if nothing else) :)

>
> Err, isn't that academic, considering r.h-r is in English anyway?

No. My dictionary (something a non-speaker might use to look up words) gives a radio oriented definition for "ham", but nothing about radio for "amateur". So, looking up "ham radio" would give the correct answer, while looking up "amateur" would leave the poor fellow scratching his head.

However, it is claimed that renaming the group to r.r.a would make it easier to find. This leaves me scracthing my head along with the other fellow.

3991. Antenna advice for beginners

Newsgroup: rec.ham-radio
Date: 1990-12-12 01:08:33 UTC
From: randall@informix.com
Message-ID: <1990Dec12.010833.20857@informix.com>
Source record: 5680

I have done quite a lot of experiments with HF antennas recently. I had
these constraints:

1) I live in a townhouse, so antennas are not "allowed". The antenna
had to be invisible, or at least not conspicuous.

2) Any wire antenna could be at most 50 feet long. (80 feet long
if I put part of it in a tree.)

3) Forget about having access to a radio ground. My room is on the
2nd floor. I read enough books that said "don't bother with
the copper stake in the ground" to know better.

I tried these antennas:

1. END-FED LONG WIRE IN A TREE. If you absolutely can't put anything
on the roof, this may be the best option. It works pretty well, provided that
it is really long. I started with a 25-foot wire; this did not work very well
on 80m and 40m, and TVI problems on 10m were horrible. Winding it around my
room and then out the window to the tree (100 feet) worked better. The problem
is that it requires a radio ground, and of course an antenna tuner. I had some
success with the MFJ artificial RF ground and a 20-foot wire on the floor.
Also, it must be installed at night. (Unless you have neighbors that
aren't suspicious of a guy throwing a wire-tied stone into a tree.)

2. ZEPP. The grand champion. I highly recommend it, as does the "Wire
Antennas" book that the ARRL sells. I bought 25 feet of the regular
Radio Shack pole mast and 8 feet of plastic pipe. (That makes 33 feet ...
just barely above the roof line.) I spray-painted the pipe sky blue, which
makes it almost invisible during the day. (at night, of course, you can't
see it anyway) I bought 80 feet of sky-blue insulated 18-guage wire and
cut it into two 40-ft pieces. One piece was stretched to just barely clear
the chimney and go down the other side of the roof, and the other piece
Went down the roof and into a tree. (This is why I used insulated wire.)
The pieces were attached to the mast and fed with 450-ohm ladder line.
(I originally tried 300-ohm TV twin lead, but performance was not good.)
The mast went up the side of the townhouse, as anchored to the ground
using the Radio Shack ground mount, and "guyed" using my window sill.
The result: fantastic! I'm finally able to work 80 meters! Also, its
performance on 10 meters is better than the verticals I tried. It's also
almost invisible. Can't beat that, huh? Of course, you need an antenna
tuner, but you don't need a good radio ground.

3. VERTICALS: Pretty disappointing. I couldn't get them up high
enough. They were also too visible. They also weren't long enough to
work 80 and 40. The reception on them was noisier too. My attempts

at building a 5/8 wave vertical for 10 meters were not exactly fruitful.

4. DIPOLES: I could have installed a coax-fed dipole in the same way
I installed the Zepp, but why? The Zepp works on all the HF bands.

5. "L" ANTENNAS AND FOLDED MARCONIS: No success. The Zepp still
outperformed them. I actually had illusions of working 160 meters.
With my MFJ artificial ground and half of my Zepp fed as a long wire,
I could theoretically work 160, but it's still not long enough. I hear
that a helically-wound vertical may work for 160 ... but I'm not sure if
it's worth the try.

In conclusion, the Zepp is a great antenna! Someday, if I ever win
the lottery, I'll buy a big estate and put up rhombic long-wire antennas.

In article <4449@lib.tmc.edu> jmaynard@thesis1.hsch.utexas.edu (Jay Maynard) writes:

RATIONALE:
==========
2. Why .amateur instead of .ham? It has been pointed out in
discussion that "ham radio" is primarily an American term, and
carries little meaning outside the US.

When this question was first raised, I agreed that this was a
reasonable issue to consider. But I haven't seen a consensus that it's
true. I've gotten private mail from Australia, for instance, which
supports the continued use of "ham." I'd like to hear from a few
non-English-speaking countries before a change is made.

In addition, there are negative connotations attached to "ham"
that don't apply to "amateur". Some confusion also exists in the
public mind about just what a "ham radio operator" is, as
evidenced by the occasional "ham operator jams aircraft
frequencies!" when the person in question has never been a
licensed amateur radio operator.

By this argument, "ham" is better than "amateur." Any non-professional
radio operator (pirate or not) is an amateur, by definition. If more
people know "ham" to mean "licensed amateur radio operator," then "ham"
better describes the intended audience for the group.

OPEN ISSUES:
============
1. rec.radio.amateur or rec.radio.amateur.misc? Both have been
proposed, and I don't have a strong preference either way. The final
proposal will reflect whatever the consensus of the discussion is.

I favor the former. I understand that ".misc" has caught on as a way
to lessen cross posting. Nonetheless, modern news readers only display
cross posted articles once, and cross posted articles don't cost more
except where the news software was implemented inefficiently using
multiple copies of articles instead of links to articles.

Aside from the cross posting issue, the shorter name is "obviously" a
better name.

And the ".misc" convention hasn't worked as well as we would have
liked. Look at what happened to soc.culture.misc. Instead of
attracting general discussion, it has actually repelled discussion.
The various ethnic groups that would have used soc.culture objected to
being "relegated" to a "miscellaneous" group, and ended up creating a

bunch of splinter groups. The ".misc" group has less traffic than any of the splinter groups. I realize that this last point is not very relevant to your specific proposal. But I oppose the use of ".misc" when the use of modern news technology instead would solve the problem.

It looks like we can bring this to a successful conclusion, especiallly if everyone maintains the same high standard of calm, reasoned discussion that's been shown so far.

That'll jinx it for sure. :-)

>
>Perry / KF0CA

I was sharpening the groundplane (40 radials now), and tuned into '.313
again. What a weird corner of Amateur Radio. Twilight zone material. :)

From what I heard, Herbie was operating squeakie-clean-legal, and
suffering hellacious QRM. My opinion is that what I heard of Herbie on
.313 is ok. Maybe he jumps down to .300 and jams, but I don't know
that. While BARF has some real lunatic- fringe ideas, the 1st Amendment
entitles them.

I'm not clear on the who-did-what-to-who,when,and-where part. It sounds
like the noise of several galaxies colliding, apparently BARF, the
Seafarer's, and some 75 meter net I'd never heard about. I think
they're all guilty - let's shoot them all and sort out the innocent
later.

In article <1990Dec10.222602.14152@eci386.uucp> woods@eci386.UUCP (Greg A. Woods VE3TCP) writes:

You point out that the term "radio ham" is understood by a growing majority of non-amateur's. However this doesn't indicate the connotations many non-operators associate with the term "radio ham".

In my experience, this term has no redeemable value with most "non-hams". In fact I would argue the connotations are so negative that we should do anything and everything we can to move to a more neutral term, and to dispell the negative connotations associated with Amateur Radio.

What are these negative connotations? I've never encountered them myself.

Anyone ever try building a cardioid DF antenna for the frequency range in question, then using conventional DF techniques ? I also have a channel 2 problem, but the thought of building a 6 meter beam has always stopped me.

>
> Lee W1/G8LCK

If you know a way, I want to hear it ! I'm sickened by ease at which anyone with a transmitter can get on the air and maliciously interfere with whomever they please. It's even worse on HF when the QRM is international.

I think the ARRL/FCC care, but tracking down radio-terrorists is a difficult thing to do. Maybe it is a reflection on the USA - we tend to have a higher per-capita rate of sociopaths. Sigh. Too bad radio waves don't stop at the border.

So, how do we get our own house in order ? Not talking with a LID doesn't work, because then the LID finds other like-minded LIDs, and form a Net. Trying to DF on HF is problematic - you may get within 50 miles of someone's site, but that's a lot of hams if it happens to be on the East Coast metroplex. Shouting down a LID makes a LID out of yourself. Maybe we need to create a new set of non-US amateur frequencies (I thought that was the idea behind the non-US voice band, but it apparently was lost on some of our cretins).

Maybe we should require another exam element - 1L(ID), which consists of writing "I will not be a LID" 100 times every time you renew.

One Concerned Stateside Amateur,

Perry / KF0CA

I think you're mistaken. By that line of reasoning, fingerprint evidence would not be admissable unless you had an eyewitness to tetify that he/she saw the defendant make that fingerprint on that object.

I don't think the average layman gives a hoot what we call ourselves and even if they do, who cares? We should call ourselves what WE want to call ourselves.

Speaking for myself, I have been quite happy calling myself a radio ham for the last 40 years. When anyone asked what 'W8GRT' was, I said "My ham radio call letters." Nobody ever came back with "What's a 'radio ham?'" A few wanted to know if that was like a CB'er, but none wanted to know if that was an actor or an advertized product on the radio. They ALL knew it was some form of personal hobby two-way radio.

So, what's the big deal? Who needs changing the name of our hobby to fit some cockamamey Usenet organization table?

Of course, if the rumor WERE to be true, it would probably be for the reasons following: 1) Code Waiver for disabled brouhaha - removed completely, and 2) Bitches about we want Novice to STAY, when FCC wants to have no more license classes (communicator should not cause more classes) answered by removing TECHNICIAN class instead, as all current Techs would be General Class under the rumored plan - grandfathered, just assumed Techs have Gen privs, no new techs issued.. simple - of course, being too simple, it's probably not gonna happen...

4002. MAJOR FLARE ALERT & MAGNETIC STORM WARNING UPDATE

Newsgroup: rec.ham-radio
Date: 1990-12-12 08:55:46 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901212015546.23800bd7@HG.ULeth.CA>
Source record: 5692

```
-- MAJOR SOLAR FLARE ALERT --

DECEMBER 11, 1990

Flare Event Summary
Potential Impact Forecast
Revised Prediction Charts
--> Geomagnetic Storm Warning Update <--
--> High Latitude Auroral Storm Warning <--

--------

MAJOR ENERGETIC EVENT SUMMARY

Solar activity was high today. A major class M6.5/SB flare occurred at
20:52 UT on 11 December, but was not accompanied by any significant radio
emissions. The flare was associated with Region 6402 and occurred at a
position of S11W80 very near the western limb. This flare was difficult to
optically correlate since at that time, Regions 6397 and 6387 were all reported
to be flaring during the event. It was later concluded that the event
originated from Region 6402 and was rated as a very small bright subflare at
optical wavelengths. Although this event did reach healthy x-ray levels, it
will not have a terrestrial impact with the earth.

A barrage of M-class flare activity occurred from the many active regions
visible on the solar disk today. Most of the activity occurred in the
northwest quadrant where most of the mature active regions are developing. A
total of five M-class flares occurred today, all class M1 flares except for the
major class M6 flare.

The elevated flare activity has produced numerous SID/SWF's. A total of
five SID's were numbered today, two of which have been confirmed as producing
shortwave fades. The first confirmed SWF occurred at 20:46 UT and lasted until
21:56 UT. The second occurred at 22:55 UT and lasted until 23:40 UT. Both of
these confirmed SWF's affected frequencies up to 13 MHz. The probability for
further SID/SWF's is high for the next 48 hours, when several of the active
regions responsible for the recent flaring should rotate beyond the west limb.

The probability for M-class flaring is 70% over the next 24 hours. The
probability declines to 65% for the 48 hour period and down to 60% within 72
hours. The decreased flaring probability is in response to the disappearance
of the major active regions beyond the west limb.

Old Regin 6368 appears to be relatively stable. It is large, however, and
the trailer region has not yet fully rotated into view. The trailer region
contained the magnetic delta configurations which could have spawned major
flares, but didn't. Analysis of this region is of relatively high priority,
```

considering the complexity that this region attained when it was last visible several weeks ago. More will be known within the next 24 hours. So far, however, old region 6368 is only listed as containing one large H-type spot and appears to be stable as the models suggested.

GEOMAGNETIC STORM WARNING UPDATE

Additional analysis of the data from the major flare of 10 December indicates that the interplanetary shock wave will likely not reach the earth until the mid or late part of 12 December. Current projections estimate impact between 10:00 UT and 24:00 UT on 12 December, corresponding to a planetary shock speed between 770 and 630 km/second. Geomagnetic activity is therefore not expected to increase until the mid to late part of the UT day on 12 December.

The magnetic storm warning is continued particularly for the high latitude regions. High latitudes should experience at least minor storming with a risk of periods of major storming. Middle latitudes are still expected to remain mostly active with a risk of periods of minor storming. A slight risk still exists for major storming over high and middle latitudes, although it looks as though the activity at middle latitudes should remain confined to K-index values of 4 and 5 (corresponding to mostly active conditions with periods of minor storming). The effects of a well positioned coronal hole could also enhance geomagnetic activity, particularly on 13 December.

HIGH LATITUDE AURORAL STORM WARNING

An auroral storm warning has been issued for the high latitude regions for the UT day of 13 December. Auroral activity over high latitudes could reach high levels on this day. Middle latitudes are not currently expected to experience any auroral storming, although activity should reach at least moderate levels over the middle latitudes. A slight southward expansion of the auroral oval is expected on 13 December, which may place some northerly middle latitude regions within the auroral zone on the evening of 13 December.

Overall activity is expected to decline to mostly unsettled levels by 14 December.

The following forecasts have been revised to account for the new data which has been received. The previously revised prediction charts are still valid but will not be quite as accurate as the following revised predictions. Use the following prediction charts where possible.

4003. Re: Call for Discussion, pass two: reorganization of rec.ham-radio.*

Newsgroup: rec.ham-radio
Date: 1990-12-12 09:18:08 UTC
From: hpa@casbah.acns.nwu.edu
Message-ID: <1878@casbah.acns.nwu.edu>
Source record: 5697
Cross-posted to: news.groups,rec.ham-radio

>2. Why .amateur instead of .ham? It has been pointed out in discussion
>that "ham radio" is primarily an American term, and carries little
>meaning outside the US.
Since some people seem to have doubted this, let me give my view of the
situation:
1. Hams/amateurs from non-Ennglish speaking countries generally understand
the term, since English has become the international radio language.
"Amateur" is used in any language (or rather the corresponding word).
2. Non-hams from non-English speaking countries generally have no clue.

>1. rec.radio.amateur or rec.radio.amateur.misc?
My opinion on this is since the ".misc" doesn't add anything to the
meaning, is should be dumped. Besides, doesn't it go against the idea of a
hierarchial naming convention?

>2. rec.radio.amateur.packet or rec.radio.amateur.digital?
Remember, there are more to digital hamming than packet. If you want to
discuss packet radio (that is, ARRL AX.25), then go with ".packet". If you
want to include discussion of Baudot (RTTY), AMTOR, and the like then go
with ".digital".

If you can find one of the old Brown Brothers Machine paddles, grab
it fast. It's much nicer than a Bencher. I'm a lousey CW operator
myself, but a friend of mine works CW mobile exclusively. He finds
a keyer difficult to use mobile. He uses a BBM paddle as a straight
key. He says the side to side motion is much easier to control in
a bouncing truck than a regular key. He has the paddle mounted on
the center console. He also advises a radio with a dial lock and not
to use too narrow filters in the receiver.

WA2SRQ asks about the iambic feature on the Super Keyer II. I can't find any way to turn the iambic off on mine. This is the first iambic keyer I have used and it has taken me a couple of weeks of solid sending practice to master it. But having done that, I would NEVER go back to a non-iambic keyer. It really reduces the amount of paddle/hand motion. I love it! One other comment: I did not get the hang of it until I read exactly what the iambic mode is, namely that when both paddles are squeezed and released, it completes the character it is on (whether dah or dit) and then follows it with the opposite character. As soon as I realized that and started planning for it, it suddenly started WORKING!! Thus, holding one paddle over while simply tapping the other one takes care of F, L, Q, Y, R, and K, while squeezing does the C. Effortlessly!

If you read the law, you can not be convicted on the evidence of fingerprints for a felony. That is SUPPORTING EVIDENCE. If all they have is fingerprints, you're free. If not then, on your first appeal.

Besides, in photo radar, who is to say there was no interference, not jamming by another vehicle (a common practice done by two individuals in NJ to PURPOSELY make innovent individuals get outrageous tickets they fight in court), or other conditions that may make the unit not lock correctly.

In most states, police have evolved POLICIES that they do NOT use autolock or alert modes, and a lot of new RADAR equipment now comes WITHOUT those features. The reasoning is, from police policy standpoint, that the OFFICER must FIRST observe a car exceeding his judgement of speed, then use the RADAR to VERIFY that fact and obtain an accurate reading.

Photo radar goes against police policy.

Message-ID: <1990Dec12.151304.29733@swbatl.sbc.com>
Source record: 5718

Amateurs seem to have a total lack of interest in broadband HF antennas
and matchers. Untill recently that also included me. My company maintains
an extensive HF system for disaster (earthquake) recovery and has switched
from 120 ft. wires with digital couplers to broadband delta loop antennas-
with good results. We probably have 180 ft of wire in the loop with
10:1 baluns inserted at the center of the base and at the apex. You
feed the loop with 50 Ohm line at the base and the top balun has 50 Ohm
cable fed back down to a dummy load. The SWR is flat enough from 2 to 9 MHz
to satisfy our 1 KW solid state linears. I realize that there is a couple
S-unit penalty, but given the difficulties of erecting an efficient
80m dipole on a small lot, it seems worth a try.

Maxcom took a lot of flack from QST about their matchers a few years back.
Has anyone ever built a simple resistive swamping unit and tried it out
on 80m? I am going to try the balun idea with some inexpensive 4:1 units
to test an idea. I thought a wire run completely around the house under
the eaves might be an effective and hidden antenna on 80 & 40m.

To add some credibility to the subject, Collins is advertising a passive
antenna matcher with their Spectrum 2000 (I think that's the name) line
of HF radios. It is a little more sophisticated and has three passive
R-L-C networks that are blindly selected by the radio by frequency band.

Frankly, our PR is very bad. Most achademics have a low view of radio
amateurs, or at least that is the impression I get. It is not a good idea
to pass on the information you are a radio amateur in some circumstances.
I think CB is to blame for this, at least in the UK.
>

This is very true. It is difficult to get any un-moderated groups, and the
undergraduates do not have access to the majority of news services. Also
the finance is of great concern. Hence, we do not see most of the Rec.*
articles here, simply as they are deleted when new stuff arrives. Every
Monday, somthing like this happens

130 unread articles in newsgroup Rec.ham-radio read(y/n)

skipping unavailable article

Article XXXX of newsgroup Rec.ham-radio (15 left),

r somthing like that. ie we lose 115 articles and only see the last 15. I
suspect this is common to many educational sites.
UKC does not pass on any of the alt.sex or alt.drugs newsgroups (not that
I would want to read them). Those who complain about people posting
uuencoded files to the net might consider that many UK sites do not have
any easy FTP access to overseas accouts. Remember, we are now a third

world economy (nearly)

The radar is NOT telemtry, even if it is gathering statistics (whether
legal or not). It is still radiolocation in that it is determining the
location or velocity of a subject. If the resultant data is transmitted
via radio somewhere else, that would, or could, be telemetry.

One thing about this keyer which is neither in the manual nor the QST article is that it uses what Curtis Electro Devices (maker of the 8044 keyer chip) calls "B" timing. This characteristic automatically adds a character of the opposite kind when the paddle is released.

This is the standard for most commercial memory keyers.

The stock 8044 keyer chip, which my old home-brew keyer used, did not have this feature. It drove me crazy until I figured out what was going on! Now, I really like the "B" timing better.

No; it would be legal because it involves the immediate protection of property and possibly of limb (maybe the intruder isn't a ham and hasn't seen a 2 KV power supply before). In such an emergency, there is no question as to legality.

>air, the miles will pass faster and your code speed will increase. Even better,
>a mobile CW signal will work much better than a SSB signal for the same
>power due to the lousy mobile antenna systems.

Brian and the rest, what has been suggested here in the form of :
try cw mobile
upgrade your ticket

are both very worthwhile suggestions; both Yaesu and Icom offer excellent
mobile rigs (I will leave out of the discussion the rigs without LCD displays
because they are practically useless in bright sunlight) which offer a companionremote
tuner for a whip, which will resonate 80-10 m, including the WARC bands;
the Yaesu 747 can even be had in a version which lets you remote mount the
control panel.

I have used the Icom 725 and AH2 combination mobile, and have over 160 dxcc
countries confirmed with it, on ssb. some were easy, some hard... but all were
fun, and they wiled away a few zillion hours driving around west texas.

Mobile cw? well, I like it, but it is not for everyone, and I would recommend
practicing it a while when someone else is driving first... it is distracting
initially, and hard if you haven't mastered the art of copying cw as words.

DRAWBACK: it costs more; lots more (pick up an AEA catalog and see...)
BUT it is well worth it, and will let you use it as base rig when you want to;
in that application, I think the tuner will tune a 40'or longer wire to 160m, sothe option

of using a longwire at home is there...(of course, avoiding any
length that looks like 1/2 wave at operating frequency...).

cheers
DFR

4021. Question for TM-731 users

Newsgroup: rec.ham-radio
Date: 1990-12-12 19:52:52 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <34651@netnews.upenn.edu>
Source record: 5656

I'm asking Santa for a TM-731 for Christmas, and was wondering a few
things:

1) When using dual-band receive (not repeater mode), can you have it
set up for one PL DECODE tone in UHF and a different one in VHF?
I would think you would need 2 decoders to do this - is this how the
731 is designed, that is, it requires one decoder for each band?

2) In cross-band repeater mode using the radio as a simplex range
extender, is it possible to require, say, the 440 side to use PL
decode while leaving the 2m side open?

3) Our 440 repeater transmits a PL tone back only when there is audio being
received through its input (i.e. it doesn't transmit a PL tone while
IDing, while giving the hourly time report, etc.). Since this is the
case, if I'm using a 2m HT crossbanded through the 731A, can I turn the
PL decode for the 440 side on so that I don't have to wait for the
repeater's carrier to drop before transmitting on my HT? In other words,
will it switch bands only after the carrier has dropped, or will it
switch whenever the squelch is closed, in this case being once the
repeater has quit transmitting PL?

4) Finally, with the PL decoder on (or off), will it pass the PL tone to
the transmitting band with the PL encoder turned off (i.e. will it
pass PL tones in repeater mode, or do they have to be regenerated)? This
question is purely academic and probably has little relevence to anything.

Thanks for the info.

Did every amateur station in the country go
>into mothballs "for the duration" ?

In a word, YES.

Amateur radio operations began to shut down worldwide as the war began. By 1940, most of Europe (and Canada) was off the air, and by 1941 little international operation was possible. After Pearl Harbor, USA hams were off; operation resumed some time after V-J day.

Remember why we still have our frequencies: Amateur bands are in fact "the RESERVES" that the military can "call up" in time of major war. During WW II, HF bands were the workhorses, so the military built all those "command sets" and other radios that conveniently were converted to ham use after the war. Since WW II, the military has sided with hams against other encroachments onto our bands. Not because they like us so much, but because they know we'll be off the air the moment they need the bands.

I'm not THAT old, but I've read a bit about it, and even once had some 1940's QSTs that were discussing what to do after the war ended and the hams could get back on the air.

4024. Re: Alternative proposal - The Grand Radio Reorg

Newsgroup: rec.ham-radio
Date: 1990-12-12 21:33:30 UTC
From: stanley@phoenix.com
Message-ID: <Jq63T1w163w@phoenix.com>
Source record: 5658

murray@sun13.scri.fsu.edu (John Murray) writes:

> Is this very reasonable suggestion a personal affront to you or something?

If you took the time to read my original reply, you will find I take no affront at all to the proposal. Go back. Look again. (If you can't find it, I will gladly repost it. There are others here who need to reread it, too.) Show me the personal affront I took. Show me the "emotion" or "wild claims" I was accused of making. None of it is there.

If you look back at my original reply to the original proposal, you will note that all I did was ask the quite reasonable question - why? In response, I have gotten some pretty silly answers. Things like how bad it is there is a hyphen in the ham-radio name. I have had the dictionary quoted to me to show how the renaming is "real progress" (somehow, the dictionary has an opinion on the renaming), even though the dictionary defines ham radio better than it does amateur. (Look up the words "ham" and "amateur". See which one talks about radio.) And I have been told that there is no effort involved in this renaming.

I am affronted by people who make grandiose claims about what a simple renaming of a newsgroup will do and get bent out of shape when someone (me) asks the simple question: why is the renaming a good thing. I am affronted by people who get bent out of shape when I question the claims of 'real progress' (which they can't support) and the other subjective evaluation they apply but can't support. Much like your use of 'very reasonable' -- you don't want to support this claim, and all I want to know is why this is a reasonable thing to do. So far, there have been no good reasons. And don't tell me it is reasonable to rename an entire tree just to get rid of a hyphen.

As someone who has to do some of the work involved, I take affront at those who tell me that because they are at a site where it is easy to make this change that nobody has any right to question how hard it will be at other sites. They don't care -- it's easy for them. Since it's easy for them, it is easy everywhere. Pah!

I take affront at the person who claimed that, since I do not include my call in my .sig or my account name or anywhere else, I must not be a ham, and then implied that since I am not I can have no opinion in the matter. The same person who implied that since he has been licensed so long his opinion was certainly more important than mine. (Ha ha for him -- I am both licensed and for about as many years; as if it mattered either way.) This is just one more ridiculous claim made by the proposal supporters.

As a result of the silly claims and arguments I received in response to "why", I generated the alternative proposal. The entire proposal was based on

what the original authors claimed they wanted to accomplish, using the same logic. It includes comments made by others, such as .cb, and expanded upon them to include a Part 15 group.

Anyone who chafes at the alternative proposal yet wants the name change must want it for some other reason than those already presented. Sauce for the goose, so to speak.

> I was going to refrain from voting at all, but now I think I'll vote just
> to piss you off.

What a nice reason to use for voting. What a nice sentiment. Certainly, if you have no constructive comments, make comments like this. Apparently, you have no arguments against the alternative proposal, since all you want to do is take pot shots at personalities.

You should examine the reason you added the john-stanley.personal.hier... I am not the one who suggested that the current hierarchy should be changed. You should point that illogic at the original authors of the proposal -- they want the hierarchy the way they want it. The Subject: CALL FOR DISCUSSION was a real misnomer. All that was wanted, it seems, was a CALL FOR AGREE WITH ME. (And remember, I did not pick the subject. The pronoun ME applies to the original author.)

Is there any doubt from the name that rec.radio.noncomm.amateur.ham is for ham radio or amateur radio? That is the prime reason for the change -- making the group easier to find. Rec.radio.amateur says only that the users are not professional users of the radio spectrum, just as the current name rec.radio.noncomm does not mean 'for professional radio only'. CB, Part 15, hobby classes in foreign countries. Yes, it will certainly add to the group to include debates about CB slang and baby monitors.

Oh, (the argument now goes) but the charter will exclude that. "Read the charter for r.r.noncomm, it says professional" I am told. If those looking for ham radio read the charter now and can't find us, then there is a more serious problem than just name. Let's fix that; it will gain us more than the name change will. The name change is a purely cosmetic move. It fixes nothing. There is no reason to do it.

But I forgot myself here. You didn't want to argue the merits of either proposal. You would rather just wave your hands and cast aspersions about the character of those you don't agree with.

I keep asking for real reasons. Nobody can provide any. If you can provide a reason, do so. Otherwise, keep your personal attacks to yourself.

I agree completely the name should remain "ham" and _NOT_ be
changed to "amateur." Ham is VERY widely recognized; I can't
tell you the number of times I've said "That's an amateur radio
license plate" and they say something like, "Isn't that the same
as ham radio?" Plus, to the average Joe Blow who is wading
through the .newsrc file on his U*ix box, rec.radio.amateur
would sound like a discussion for a bunch of DJ's from the
college radio station. :-)

Keep it "ham." Definitely.

Regards,
Eddy, N8FPW

Does anyone have the morse code in ascii?
I am studying for my radio operators licence, and
I just wrote a program to send me some beeps and
bops for dots and dashes by reading from a text file.
The problem is that I don't have codes for each
of the letters and the numbers and special characters.
Could someone send these to me? eg:

o - - -
s . . .

Also, could someone tell me what the delay in terms
of unit time that one has to have between letters
(characters). And between words?

I'll probably put this up for anonymous ftp after
I have done with it. Eventually it should be able
to take *in* morse and give the characters. It will
also have a noise includer. Something that will "forget"
to beep one or two dots or dashes in a word during
transmission. Good for real-time simulation.

Say, why do people use morse nowadays anyway?

randall@informix.com (Randall Rhea) writes:
> I read enough books that said "don't bother with
> the copper stake in the ground" to know better.

I'm curious about this. Am I wasting my time to ground my radio to
a copper stake? Why? And ... what about this aluminum "ground wire"
that I bought at Radio Shack? Not conductive enough?

I have a 40 meter dipole, full size. Sometime next year I'll convert it
to a zepp when I can buy an antenna tuner because I'd love to get on
80 meters. My rig is getting into the VCR in the living room, but not
the cable TV line. It does get into my TNC, and causes it to key the
PTT on the 2m rig whenever I key the radio. I'd love some suggestions
for dealing with these things.

About all I've thought of starting with is (a) grounding the rig, and
(b) getting a stack of power line RF filters for the rig and some
of the appliances.

Should I not bother with grounding the rig? Is it a waste of time?

Piffle! I own a Brown Bros. paddle and a Bencher. The Bencher has a
much finer feel and control to it. Besides that, the Bencher has a
heavier base, and doesn't move around on my table. I couldn't use the
Brown Bros. paddle without having a spare hand to hold it down.

I suspect that you would find the Brown Bros. paddle preferable if you
use heavy finger forces. I'm not sure. I do feel like my Bencher is
the best I've ever used.

Right now my BBM paddle is on loan to Ed WB2GOH who's enjoying using it.
There's nothing wrong with it, I just like the Bencher. :)

^^^^^^^
Make that class A licence if it's British.
>Britain but will be in the US for a number of years where I am at grad.
>school. Can I just get a reciprocal license or do I have to subject myself
>to some other procedure.......??????

Strictly there's no reciprocal license, just a reciprocal operating permit,
that lets you operate your British station in the US. Just get form 610A
from the FCC and return it with a copy of your licence. They send you
your permit in a couple of weeks (much faster than getting a US license).
It's good for one year, so repeat this procedure annually. You can't
get a permit if you become a U.S. citizen or hold a U.S. license.
The downside is that you are bound by the terms of your own licence and
also the U.S. extra class license, so in theory you can operate Stateside
between 144 and 146MHz, but not between 146 and 148MHz, and not on
222MHz at all. In practice no-one cares. And the subset of the two
sets of regs. for packet would take a civil servant to untangle. Anyway
you'll find that tnc2's don't understand reciprocal callsigns (GW4WFX/W3) :-(
So your best course is to get a 610A permit to get on the air, then start
working for your US license (much easier to get than a British licence).
But be careful, if you fail the 13wpm code test, do not take the 5wpm test
or you could end up with fewer priviledges than the 610A gives you. 73.

Oh? If you have a badly leaking water heater do you call an amateur
plumber? When you are deathly ill, do you go to an amateur doctor? If
you are involved in a law suit do you seek an amateur lawyer? Unless you
answered YES to all three, then you yourself harbor negative feelings toward
the word amateur.

am-a-teur n.
2. a person who does something without
professional skill

from the Webster's New World Dictionary, 1988. The Living Dictionary includes
a phrase something like "usually with crass connotations".

The main problem with the term amateur is it is not specific about amateur
what. Ham-radio is rather specific.

I agree with the comment about using CW. It is definitely illegal to modify
a ham rig to operate on CB as the radio is not type-accepted for that service.
I also believe that modifying a CB to work on the ham bands would invalidate
its type acceptance for CB, even if CB performance were unaffected. But I
won't tell if you won't.

This sounds like a small terminated rhombic. I believe the loss is on the
order of 3 dB (half an S-unit.)

> Maxcom took a lot of flack from QST about their matchers a few years back.

The Maxcom unit is little more than a resistive attenuator between radio
and antenna. The loss is undoubtedly a lot more than 3 dB.

Any telemetry transmitter must have a control operator. I'm not sure if
"automatic control" is legal for telemetry. In the case mentioned above,
you could probably justify it as an "emergency" transmission. (It must
be an emergency if there's an intruder).

I'm as good an armchair lawyer as anybody else! :-)

One of many scratching their heads right along with you is Masahiro Kitagawa of the NTT Research Labs in Tokyo who sent me e-mail agreeing that all this name changing talk is D U M B. Adding rec.ham-radio.legal is a good idea. The rest of the proposed change should be dropped as one of those ideas that pop up at 3 A.M. after eating tacos.

> .... look at the 14.313 zoo ... etc ....

It doesn't surprise me that we have more intentional QRM in ham radio, or
more profanity, more hogging of frequencies, less tolerance for other
hams, etc. We have these things in the rest of society too. As long
as our society promotes a "look out for number one" attitude, these
problems will just get worse. If you want a good example of "societal QRM",
just go out driving in rush-hour traffic. Or stand in line anywhere for
anything. Or go to a sporting event where there are a lot of drunk
people.

4041. Please submit WA4SIR QRZ beacons copied

Newsgroup: rec.ham-radio
Date: 1990-12-13 02:57:41 UTC
From: winter@Apple.COM
Message-ID: <47335@apple.Apple.COM>
Source record: 5639
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Tom Clark of the SAREX team reports that so far he has only received about a dozen reports of QRZ beacons copied from the WA4SIR robot packet station aboard STS-35. Those beacons listed the calls heard but not necessarily worked by the robot. (I.e., calls captured by the TNC's MHEARD command.)

****
* Unlike the list of stations actually worked by the *
* robot, the MHEARD list was NOT stored by the TNC. *
* This means that stations heard by the robot will *
* not be eligible for QSL cards unless the SAREX team *
* sees QRZ beacon text containing their callsigns. *
****

So PLEASE, if you captured any QRZ beacons from the WA4SIR robot, forward them to SAREX@W3IWI.MD.USA or to sarex@tomcat.gsfc.nasa.gov.

One of your friends may wind up with a SAREX QSL this way! Maybe another Usenetter! Maybe me! :-)

73,
Patty

>that one is needed that would change my mind.

Jim is dead on the money. A rec.ham-radio.tech or (gag) rec.radio.amateur.tech is just what we need. The packet subgroup and the cries over the demise of Ham Radio magazine demonstrates that there is a fairly large following for technical discussion among the members of rec.ham-radio. Also a group with a technical charter seems to avoid much of the flaming found in the base group. I believe that the .legal proposed group would be a source of cross posts to the base group and a subject of endless flame wars consisting of "this belongs in legal" "no it doesn't, it effects us all" type exchanges. The last thing we need is yet another subject to bicker about. Also almost all of the "legal" rangling that prompted this group pertains to USA hams only and should be distribution limited to US sites, preferably by a mailing list not a full usenet group. Ham radio is a technical hobby first and formost and deserves a tech group. A rec.ham-radio.misc can hold the remainder.

4043. RE: NEW NOVICE seeks advice on first rig

Newsgroup: rec.ham-radio
Date: 1990-12-13 04:54:15 UTC
From: stevens@mpx2.lampf.lanl.gov
Message-ID: <8761@lanl.gov>
Source record: 5663

Ref: netnews e-mail from Jeff...

First of all congradulations !!!!!!!!!

I've found all the advice on rigs posted have been good ones.
I'd like to address your antenna quest. A subject of wide
variety and considerable controversy, this depends on not only
your budget, but also the space at your qth and local zoning
rules...The following based on experience:

A. NON-DIRECTIONAL TYPES (mostly)

1.) VERTICALS: Good for DX; need small amount of space for
the actual radiating element, but the ones that resonant
at 1/4 wave definately need a good ground plane system of
at least 1/4 wave. If you figure on a good ground plane
that comes out to need a considerable amount of space.
Also, just for your info. studies have shown that a
ground plane that is elevated above the ground works
better than one that is on or below ground level. An
alternative is a vertical that resonates at 1/2 wave.
I know of one on the market (maybe someone knows another)
that is the R5, and it's > $200. Antennas 1/2 wave long
are very independent of a ground plane so you would not have to
worry about the space problem of a ground plane. Also, the
angle of radiation is considerable lower thus providing
improved DX possiblities.

2.) DIPOLES / AND OTHER VERSIONS THEREOF: Big point; they
are inexpensive and work well. I've tried many types and
happen to like the G5RV nonresonant balance fed version.
51 foot legs for 80 to 10 (double that works great for
160 to 10) and 450 ohm open wire balanced feed (see other
postings on this antenna). I have made many DX contacts
on mine most to Japan and England on 20, 15 and 10 with
25 watts PEP output SSB ! Although you'll need to use
an antenna tuner (the Delta-T design works best, you can
build on or buy one...MFJ just has just introduce one),
its advantage is that you can tune it to resonate the antenna
on all bands. Also, the antenna seems to work reasonably well even
if the legs are not straight and use of the antenna tuner
give you some degree of RFI suppression. And the antenna
itself is quite efficient due to the fact that there are
no loading coils in the radiating elements, although one
does loose some power in the form of heat in the antenna
tuner.

B. EXPENSIVE STUFF
1. BEAMS: You could go with a wire type i.e. Rhombic, but you'll need alot of space. Or with a rotatable yagi or quad. You'll find yagis to be easier to tune and better able to survive adverse weather conditions... Well you'll need a tower, best to have it at least 50 feet (big bucks here). All yagis on HF are basically the same. Most have only 10, 15, and 20 mtrs. To get on 30 and 12 mtrs (when you upgrade) would require additional beams. KLM makes some tribanders that tend to be somewhat more efficient due to the fact that they do not use the common loading coil method to resonant the elements. This method gives you a broad resonant passband with steep sides. I mention this because I use this type of loading to resonant the antennas I design and build on 10 mtrs and up...

...In the past I bought all my antennas, but now design and build my own. Yes it takes time, but I like the performance.

enough for now,
Let us know what you end up with...
Gud luck,

Thad KG5ES

4044. Timely Keplerian Elements?

Newsgroup: rec.ham-radio
Date: 1990-12-13 06:11:14 UTC

I have and continue to use the NASA 2-line keplerian elements sets posted in these groups. Much nicer than waiting for the "big brown envelope" from Goddard. However, other than dialing up the Celestial BBS for the latest elements, is there an ftp site I could grab them from? I know about the nachos.ssesco.com site, but these are only updated weekly. Is there a way to get the bulletins as they are issued via the net?

Comments/suggestions/"you're crazy" letters welcome...

4046. MAJOR SOLAR FLARE ALERT & UPDATED WARNINGS

Newsgroup: rec.ham-radio
Date: 1990-12-13 09:19:10 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901213021910.23800e4b@HG.ULeth.CA>
Source record: 5664

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 12, 1990

Flare Event Summary
Potential Impact Forecast
Revised Prediction Charts
--> Geomagnetic Storm Warning Update <--
--> High Latitude Auroral Storm Warning Update <--

MAJOR ENERGETIC EVENT SUMMARY

An explosive surge of solar activity occurred today. There were a total of eight M-class flares today. Two of these were major energetic events. The largest event was the class M8.9/SF flare which occurred at 14:10 UT on 12 December. This flare originated from Region 6398 at a position of N10W72 and lasted 71 minutes. This region will disappear beyond the west limb tommorrow. No significant bursts or sweep frequency events occurred with this flare.

Region 6399 was by far the most active flare-producer today. It was responsible for five M-class flares today, including the major class M5.1/SF flare which occurred at 08:03 UT on 12 December. This latter event occurred at a position of N20W73 and lasted 57 minutes. No significant radio bursts or sweeps were observed from this event either.

Among one of the M-class events of today was an M1.6/SF flare which also originated from Region 6399. This flare is worthy of note because it was accompanied by a Type II sweep. The flare occurred at 11:12 UT and lasted 36 minutes. The shock velocity of the Type II sweep is estimated at 2000 km/sec.

No significant proton enhancements were observed today, despite the amount of solar activity which has occurred.

A significant drop in the solar flux is anticipated over the next 48 hours as the very active regions in the northwest solar quadrant rotated out of view beyond the west limb. The solar flux is expected to drop by as much as 30 points by 15 December.

As the regions in the northeast rotate out of view, all attention will be shifted to the northeast quadrant where Region 6410 is showing signs of increased flare output. Over the past 24 hours, Region 6410 (N05E32) has rapidly increased in size from 1,320 million square kilometers to 1,830 million square kilometers, an increase of 510 million square kilometers. Area, flare output and sunspot numbers have also increased within this region over the past 24 hours.

Regions 6398, 6399, 6410 and 6412 are all capable of spawning M-class flares. They are also capable of producing isolated major flares. Regions 6398 and 6399 will be out of view on 13 December and will not return to the eastern limb until near 27 December. Regions 6410 and 6412, however, are still in the eastern hemisphere of the sun and will remain in view for quite some time yet.

Region 6412 (old region 6368 which was enormous in size on its last appearance several weeks ago) has retained a great deal of it's size. Today, a significant portion of its old trailer spot complex rotated into view. Hence the size of the region was adjusted accordingly and now stands at 3,870 million square kilometers. The trailer spot region has definitely decayed since it was last observed several weeks ago, but this region is still capable of spawning M-class flares.

The sunspot number has been decreasing steadily over the past 48 hours, due to the rotation of active regions beyond the west limb. At the present time, the sunspot number is 208, but will drop further as the major active centers rotate out of view. Likewise, the x-ray background flux is expected to begin dropping over the next several days from its present C2.1 level.

GEOMAGNETIC STORM WARNING UPDATE

Geomagnetic activity increased notably between 22:00 UT and 24:00 UT on 12 December due to the effects of the major solar flare of 10 December. Activity has remained confined to mostly active levels over middle latitudes. High latitudes have experienced periods of minor storming.

Activity is expected to calm down somewhat on 14 December, but should be followed by another increase of activity due to the major solar flares which occurred today. This second increase of activity is expected to occur on 15 December. Levels of activity should be comparable to the activity experienced today (12/13 December). No significant storming is expected, although periodic minor storming may again recur over high latitudes.

HIGH LATITUDE AURORAL STORM WARNING UPDATE

The auroral storm which was anticipated for high latitudes never reached the intensities anticipated. Significant periods of auroral activity has occurred over the high latitudes, but the activity has been relatively localized. The auroral storm warning has been cancelled for all regions. Localized periods of high auroral activity may still be possible, but such activity will be isolated.

A slight southward expansion of the auroral zone was noted on 13 December, but the expansion was not enough to permit observations from low latitudes. It is expected to return to its normal position over the next 24 hours. However, it may again migrate southward slightly when the effects of today's major flare's reach the earth on 15 December. No significant migration is expected.

The prediction charts have been revised yet again to compensate for the major flare activity which occurred today. The previously revised charts are still valid, but will not be quite as accurate as the following revised charts.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (09 DECEMBER - 18 DECEMBER)

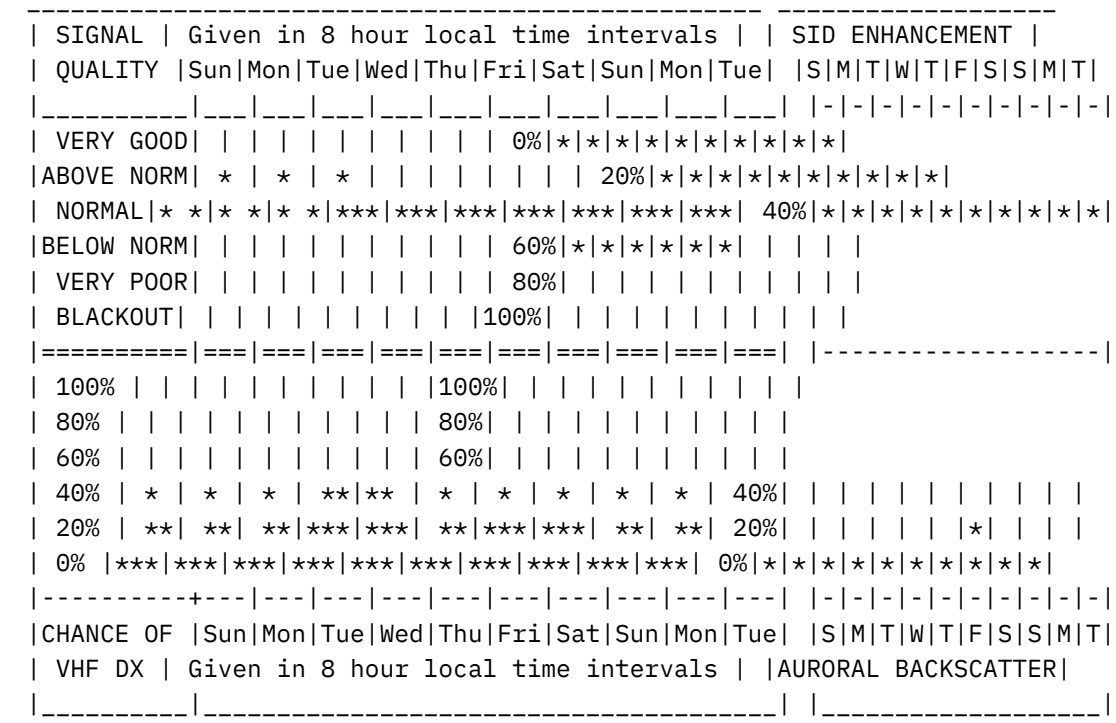
LOW LATITUDES



NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

>AL N1AL

OUCH!!! I can think of many more phrases that are eminently more
relevant. How about the niceties or are manners dead! S'il vous plait
(PLEASE) [pronounced - si vu play - excuse weird phonetics] gets you
a *very* long way. Merci (THANK YOU) [mercy] is another good one.

My advice to anyone travelling to *any* country is to invest in a
phrase book and learn these plus the basic greetings. Then you can
employ them with words you have picked up or sign language.

Flames to soc.culture.french

John.

4048. FTP for non-Internet sites

Newsgroup: rec.ham-radio
Date: 1990-12-13 12:53:00 UTC
From: GOODWIN@SMCVAX.BITNET
Message-ID: <9012141354.AA29816@ucsd.edu>
Source record: 5643

I've noticed several comments concerning the use of LISTSERVs for placing files, since some sites, including mine :^), have no FTP access. I didn't see anyone else mention this, so I thought I would.

Any site with BitNet access can FTP files through the BITFTP server at PUCC. This server accepts mail messages with FTP commands in the body of the message, then performs the FTP transfer by proxy and mails you the result. It's awkward, a little slow, but it works. I just FTP'd the KH113013.EXE from KA9Q's node, and it came to me as 12 individual mail messages. I concatenated them, uudecoded the resulting file, and it worked just fine. I have not yet been able to get binary files in their native form, but uuencoding works fine. If anyone figures out how to get a binary directly, I'd sure like to know. I'm on VAX/VMS with JNET.

Anyhow, for more info you can mail a message containing the word HELP to BITFTP@PUCC and get the help document. I'll be happy to provide any help I can if you get stuck.

4049. 20 meter problems (long)

Newsgroup: rec.ham-radio
Date: 1990-12-13 13:11:03 UTC
From: whester@isis.cs.du.edu
Message-ID: <1990Dec13.131103.12590@isis.cs.du.edu>
Source record: 5644

I found the following article on my local packet BBS...
good ideas for discussion and resolution of 20 meter mess:
Copied text follows:
==========
Date: 901129/0223
From: K4EID @ K4EID
Message-Id: <17852@K4EID>
To: ALL @ ALLUS
Subject: Re BARF and other sociopaths

I propose we look at this BARF nonsense from another aspect. It was amusing at first to see these and some others start flaming everything and everyone with their verbal diatribes. But after days of nonstop garbage, it has ceased to be funny.

At even a hint of a request for some moderation the response is "you're censoring" or "you're violating my freedom of speech" which gets a few more people sending flames who don't really even know what the issues are. Around and around the mess goes, all triggered by a few well primed and prepared people who are playing games with the sensibilities of those on packet radio.

I have a couple of questions for you to ponder, however. Do you think if they or the KKK or the skinheads (or any of the others who profess to have the same misguided beliefs that they obviously do) walked into the offices of the press services or newspapers in this country, or into the offices of Time magazine, U.S. News and World Report, or any other credible organ of free speech and handed them the buckets full of crap they are flowing onto ham radio, that it would be printed? Do you think it would be printed even after cries of CENSORSHIP?

In fact, I believe there are marked similarities to the tactics being used by BARF as those described in "Marketing cynicism and vulgarity" by John Leo on page 23 of the December 3, 1990 issue of U.S. News & World Report. I quote from that article...

"Charges of censorship have been raised by the author and others, but this is a diversion and a bogus issue. There is no censorship issue here because no governmental body is involved telling us what to see and read. No one has a constitutional right to have his splattered fantasies published. Thousands of grotesquely violent novels are rejected by publishers every year, and this one should have been among them."

Isn't most of this garbage being rained upon us by these BARF bags just as offensive to the sensibilities of most of us?

"How can we get this dangerous junk out of the culture? Short of censorship, everything possible ought to be done, beginning with a serious national debate. Maybe it will eventually come down to boycotts. In the meantime, maybe we should recycle Nancy Reagan's slogan, "Just say no." The career of Andrew Dice Clay began to unravel the day that Nora Dunn and Sinead O'Connor stood up and refused to perform with him on "Saturday Night Live." That touched off a chain reaction of noes that included Jay Leno, David Letterman, MTV and more and more of the public."

I propose then that censorship has nothing to do with it. It is simply a matter of common decency and common sense. We do not stand and listen to these hate mongers rave on a street corner exercising their free speech. Nor do we let them into our homes when they show up ranting and raving about first one issue then another. Like the publishers, we have no obligation to hold the loudspeaker or give them our ears or the postage stamps to spread their distortions and opinions. Use common sense - if they want to communicate their own biased views, fine, but let them do it by connecting to and communicating with those that share their distorted opinions. If you want to connect to them, then that is your right (and your problem). At least it gives you the option of deciding for yourself.

Even if you are hundreds of miles away -- it's time to say "I'm sick and tired of this garbage and I'm not going to take it any more". If the guy up the street wants to fill the ears of you and your family with filth do you stand and listen? No! If a radical group wants to put posters and signs on your house or in your yard, would you let them - no. Then why do you let them put the same objectionable materials on your radio and computer equipment? So let's quit providing free newspaper services for the distasteful rantings of a bunch of sickos. If the next BBS up the line insists on continuing to rain this trash on you, then shut him off. This mode has too much to offer ham radio to let a few ruin it. And if you think they can't, look back a few years at Citizen's Band Radio and ask yourself what happened to one of America's most popular pastimes ? If you listened to the filth that was being aired in the same ways there, people with common sense and decency just turned the radio off and put it in the garage never to be used again. Do we want that same solution to the same type of problem in Ham Radio ? - I think not !! We have more options available to us than the CBers did. We don't have to listen or promulgate their rantings.

Yes, there will be some variations in the judgements of various SysOps, but let's let common sense prevail and do the best we can. Debating valid issues in an objective way is one thing. Bigoted propaganda is yet another.

Think about it.

>
> First of all there is NO REASON to restrict frequencies on the basis of
> code speed proficiency EXCEPT to keep the HF bands from becoming like
> the CB band (the SSB portion of 80 and 20 already are).

It should be totally obvious by now that this is a failure. The code test has NOT prevented 80 and 20 from becoming like CB. Indeed, on the basis of what happens on the air these days and on the basis of the truly bizarre statements by code testing advocates, I have come to the conclusion the learning Morse code produces brain damage. The more highly proficient one becomes, the more unmistakeably deranged the behavior he exhibits.

There is no doubt in my mind that all Morse code products (keyers, computerized code teaching programs, etc.) should not be permitted to be sold or otherwise distributed without warning labels by the surgeon general. In fact, it may even become necessary to declare Morse code as a controlled procedure for which a doctor's prescription is required and which can be administered only by registered therapists.

It seems reasonable that a few generations from now, this communications technique will be looked back on by our descendants is being part of the primitive behavior period of history which included medical treatment by leeches, bloodletting, and surgery performed by barbers.

If it is still unclear, the 'official' descriptions of 'TOR (which was
originally invented by the Phillips Co. for the Dutch post office for maritime
telex use) can by found in the ITU's CCITT Recommendation #476.

I am the keeper of the nachos.ssesco.com site... I get the elements
mailed to me directly from Dr. Kelso at the same time (or before)
he posts them to various newsgroups. I'm pretty certain he only
gets them on a weekly basis (or at least only releases them that
often). If there's a faster way we'd sure like to know--

>>to some other procedure.......??????

>Just get form 610A
>from the FCC and return it with a copy of your licence. They send you
>your permit in a couple of weeks (much faster than getting a US license).

I would like to add to this. Since UK licences are renewed every year,
and a fee is paid, the FCC needs proof that your ticket is current.
When I first looked into this, about 10 years ago, I was told that I
would have to send the receipt for the fee I paid for the UK licence
along with the form 610A. It used to be that you only got a renewal
receipt if you specifically asked for it at the time of renewal.

In the end I found it so easy to get a US license that I just went ahead
and did it.

As I said, this was a long time ago, so check the current regs.
Does one still pay anually in the UK? How much is it now?

"Oh! So *you're* the cause of my TV going on the blink!"

Talk to any ham with a large tower and beam. He'll tell you that the
neighbors think that the beam makes TVI worse, when, most likely,
it reduces it (because the radiating elements are being spaced from
the susceptible devices.).

In the '70's, it was common for hams to be blamed for CB mischief.

From: faunt@CISCO.COM
Message-ID: <9012131819.AA07478@ucsd.edu>
Source record: 5652

If the source code were available, as I think it ought to be, then it'd probably be within many people's capabilities to turn off the iambic mode, or make that selectable. One of the advantages of building your own gear is that it can be customized, but without the source, this is pretty difficult with software.

As a tech, whose hangup on upgrading is code speed (I already passed the entire set of theory/regulation tests once), I would like to get the privileges, if the rumor happens to be true, but would also feel cheated of the necessity of earning the upgrade.

4061. SHUTTLE ROBOT QSO REQUIREMENT

Newsgroup: rec.ham-radio
Date: 1990-12-13 18:30:02 UTC
From: mac@idacrd.UUCP
Message-ID: <829@idacrd.UUCP>
Source record: 5579
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Howdy:

I fear that AMSAT has not been emphatic enough in pointing out what
is required for a successful shuttle ROBOT QSO. I disagree with
these stringent requirements so don't shout at me (i.e. don't shoot
the messenger). Let's say you connected to WA4SIR and you got the
UA (your TNC said *** CONNECTED TO WA4SIR) and then you received
your QSO number (Hello N4HY you are QSO # 234 . . . etc). You have
a QSO and your QSL is in the mail right? _NO_ _WRONG_.

The following procedure is REQUIRED for you to be in the log IN
ANY WAY upon its being dumped on the ground.

(1) You send a connect request to WA4SIR (SABM You->WA4SIR)
(2) You receive an ack from WA4SIR (UA WA4SIR->You)
(3) You receive your QSO # from WA4SIR (I WA4SIR->You)

I would have said here you were done and should be in the log
but IF AND ONLY IF you have <completed> the next step are you
in the log. THERE IS NO REPRIEVE.

(4) YOUR ACK TO THE I FRAME IS HEARD (RR You->WA4SIR)

A small percentage of those with QSO numbers managed step 4 as the
crowds went wild after hearing a few get through 1-3. About the only
way can you be sure that (4) was completed is that you will receive a
QSL card from ARRL.

IMNSHO this was clearly a mistake. On the earlier missions if they
heard you on a audio casette you got a card. If I sound down
its because I too am in the QRZ and NOT the QSL list after two
successful connects. I am urging that this be modified for the
Ken Cameron mission. Comments?

> How did he fall??
>

It is postulated in all the biographies I have read, that as a result of
his decision to settle out of court on theft of intelletual property
with RCA (whom he claimed stole FM and superhet from him), he became
despondent and jumped. The timing of the events does make it appear this
is likely.

String platic clothesline through the slots and stretch it taut between
supports.

> Or how about a good way to bring it into the house. I am thinking of

> go through the holes. Any better ideas?

Take a low power air rifle (or a pea shooter) and shoot two BB holes the right
distance apart in the middle of the nearest window. After fishing the wires
through, seal with silicone putty.

Yes but I wonder how long it will be before some ham sues on the basis of
reverse discrimination or some such thing as this. If an exception is made
for a certain group, the death of the requirement cannot be far behind it
would seem to me.,

>Ok, so what kinda licence would I need to (legally) operate a radar gun?

K-band radar guns transmit inside the K-band amateur band, so you're legally allowed to transmit there. X-band guns are only slightly higher than the amateur X-band allocation, but you could probably tweak the Gunn oscillator down a bit by varying the voltage a bit and/or retuning the cavity. The question that comes to my mind is whether or not this is one-way communications. I don't know whether or not one-way communications applies to transmitting with the intent of receiving your own signal back. It's two-way communications, only you are both the sender and the receiver, so I *think* it's legal. I'm sure somebody will clarify this...

>In the real world, if the operation were sporadic, would anybody really
>care?

Care? Probably not, unless you were causing inteference.
Find out? Highly doubtful.

You could apply for a radiolocation license. I don't know what the requirements are. I know you can get one if you say that you are going to use it for sports purposes, such as clocking baseball speeds, skiing speeds, or cars at a racetrack or drag strip (as long as it's a legal operation). You may even be able to get a license by saying that you are going to use it for some sort of an academic excercise, such as determing path loss given varying weather conditions or something to that effect.

I bet you could modify some TV twin-lead standoffs to work with the
ladder line.

To bring it into the house without drilling holes, use two peices of
coax braid flattened into a strip. Insulate them with electrical tape
or whatever and run them between the sill and (casement) window. You
should then be able to shut and lock the window without damage.

Well, thanks to the good graces of Joel Magid (magid@esis.enet.dec.com),
we have the following press releases today from the FCC.

Report No. DC- ACTION IN DOCKET CASE December 13, 1990

FCC ESTABLISHES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE
(PR DOCKET 90-55)

The Commission has revised the examination requirement for the
Technician Class operator license, thereby creating a new codeless class
of amateur operator license. After these revisions become effective, an
examinee will not be required to prove that he or she can send and receive
texts in Morse code telegraph signals to qualify for a Technician Class
amateur operator license.

The amateur service currently consists of five classes of licenses
having increasing privileges and each being progressively more difficult
to obtain. The classes are Novice, Technician, General, Advanced, and
Amateur Extra.

The FCC noted that offering a codeless class of license that
authorizes control operator privileges at stations which transmit
exclusively above 30 MHz, provides an entry level opportunity to
otherwise qualified persons who find telegraph a barrier to pursuing the
purposes of the amateur service.

Therefore, the FCC has established the Technician Class as the
codeless class of license. This license includes all amateur privileges
above 30 MHz. The Commission also amended the rules to grandfather
frequency privileges below 30 MHz to current Technician Class licensees.

In addition, the Commission decided to retain the Novice Class operator license in order to provide an alternate entry level operator license opportunity to persons who desire to pursue the purpose of the amateur service and who can pass a telegraphy requirement in place of the more comprehensive written examination requirement for the codeless Technician Class operator license.

Action by the Commission December 13, 1990, by Report and Order (FCC 90-///). Commissioners Sikes (Chairman),

-FCC-

Report No. DC- ACTION IN DOCKET CASE December 13, 1990

FCC MAKES AMATEUR SERVICE MORE ACCESSIBLE TO HANDICAPPED OPERATORS (PR DOCKET 90-356)

The Commission has amended its rules to make the amateur service more accessible to amateur operator licensees who, because of severe handicaps, are incapable of passing the higher speed Morse Code telegraph examinations. However, the FCC declined to provide a list of disabilities. Instead, the judgment of a physician will be relied on to establish that a person is severely handicapped and cannot pass a telegraphy examination.

On August, 1, 1990, the FCC proposed exempting from the 13 and 20 words per minute (wpm) telegraphy examinations amateur operator licensees who are incapable of passing those examinations due to severe handicaps. Because of the international requirements, however, no exemptions would be granted from the 5 wpm telegraphy examination.

The rules adopted require a physician's certification and a release permitting disclosure to the FCC of medical information pertaining to the handicap. The Commission said that the term "physician" would be limited to practitioners with full medical privileges, that is, doctors of osteopathy or doctors of medicine.

With respect to whether administering volunteer examiners (VEs) should administer examinations that they had not passed, the Commission said that any VE who is not competent to perform the VE functions should not administer examinations.

Action by the Commission December 13, 1990, by Report and Order (FCC 90-///). Commissioners Sikes (Chairman),

>I'm curious about this. Am I wasting my time to ground my radio to
>a copper stake? Why? And ... what about this aluminum "ground wire"
>that I bought at Radio Shack? Not conductive enough?

Grounding is important for lightning protection. Best is to run the
coax through a lightning arrestor before the coax enters the house, and
ground the arrestor to an 8-foot ground rod using a very short, fat wire.

If you have "RF in the shack" due to RF currents on the feedline,
this should help that problem as well as long is the wire is really short,
like no more than a foot or two.

Running a wire (even heavy braid) from the station equipment ground out
to a ground rod usually won't make a decent RF ground, and is shaky for
lightning protection as well.

Aluminum is an excellent conductor (although not as good as copper).
The problem is that there is danger of galvanic corrosion if you try
to connect it to copper.

4072. No-code announcement

Newsgroup: rec.ham-radio
Date: 1990-12-13 21:21:24 UTC
From: martin@cellar.bae.bellcore.com
Message-ID: <1990Dec13.212124.17756@porthos.cc.bellcore.com>
Source record: 5584

I just called the FCC to ask about today's rule changes re. no-code.
The individual that I spoke to seemed to be hedging his answers to
my questions, maybe because they are still working on the exact wording
of the public notice.

Anyway, what he told me was this:

1. The code requirement for Tech class has been dropped.

2. Tech class will only have privileges below 30MHz when they pass the
morse element.

There will surely be other ramifications to all this that will
come out in the public notice.

Since this individual appeared to be rather cagey, I didn't ask about
other morse requirements (handicapped or non-handicapped.)

So what this boils down to is this: still one tech license, two
different sets of privileges.

<editorial mode on>
How will they enforce this? Seems like a mess to me.

Martin Harriss KB2JYZ (now a <30MHz tech!)
martin@cellar.bae.bellcore.com

Disclaimer: This is a breaking ham-radio story, and all the details have
yet to come out. If I have misunderstood something that was told to me,
I apologise. If the FCC told me something wrong, too bad. Watch this
space for details!

4073. FCC announces new licence class

Newsgroup: rec.ham-radio
Date: 1990-12-13 21:37:50 UTC
From: jeff@xanadu.com
Message-ID: <1990Dec13.213750.27374@xanadu.com>
Source record: 5486

Most of you probably already heard from other sources,
but oh well, I'll post anyhow.

I called the ARRL during lunch today. The guy in
regulatory affairs said that "the FCC announced
that basically the morse code has been dropped
from the tchnician class license and that the
priviliges have been changed to allow operation
only 6 meters and above. There will also be
a more difficult test for technician".

So there you have it. A code free amateur license.
Sorta like the U.K. license. He didn't mention
any other changes, so I assume the novice license
still exists, and that novices can upgrade to the
new license by taking the more difficult test. He
also didn't mention what will happen to existing
technician class license holders; I assume they will
keep their priviliges.

Do you have a computer nearby? A past issue of 73 magazine discussed building a QRP transmitter from a standard dip oscillator running at 28.636 Mhz. I believe that it's a fairly common component in some computers these days.

It was the first article I've seen where they applied the oscillator directly to a direct conversion circuit yet used a potentiometer on the output as the hundreds of milliwatts was too high an output.

For conformance with antiquated regulations, because they're old-fashioned, or because they're stranded on a desert island which is well-supplied with analog electronic parts but has no digital parts. Morse is basically obsolete, since digital modulation techniques are far superior at punching clean signals through noise.

A distinction should be made betweed RADIO ground and ELECTRICAL ground.
You stake-in-the-ground may work OK for electrical ground, which is
necessary. For radio ground, though, it's useless, unless you live
next to a salt marsh or something. Fortunately, you are using a
center-fed antenna, which does not require a good radio ground.

If you use a end-fed antenna, (like a long wire or a 1/4 wave vertical)
you need a good radio ground.

>its because I too am in the QRZ and NOT the QSL list after two
>successful connects. I am urging that this be modified for the
>Ken Cameron mission. Comments?

This was not a small mistake. This was a MAJOR 30 dB error!

This procedure ensured that operators keep trying even after all
reasonable conditions had been met. Fortunately for the QRM, some
who believed the published procedures quit when they got the QSO
number. They will be penalized for following the instructions and
not adding to the QRM.

There were many published notes that claimed that once you had
the number, that was it -- you had a complete contact. Now, after
the mission, apparently, they change the rules.

Even as it was, I have log files showing some stations connecting
over and over, and getting lots of different QSO numbers. If the
system had worked as advertised, these folks would not have been
rewarded for tying up the channel and blocking out the smaller
stations.

Hopefully, people who believed AMSAT in the past will be less willing
to do so in the future.

Well, you still don't like it. Perhaps if you tried 20 meters in
the section between 14.0 and 14.1 MHz, you might find otherwise.

But then again, you are too busy flaming.

For everytime you have been asked the above question, down south I've gotten
the reply, "OH you mean CB!" And what follows is an attempt to explain
the difference between the two services...
It needs to be changed, not just because of regional perceptions which vary,
but because of international recognition.

>Keep it "ham." Definitely.

I disagree. It should be changed to amateur. What does your license say?
It says amateur, not ham.

OK, I think I know what the answer has to be, but I want reassurance.
I passed the Novice and Tech theory and code tests on December 8, 1990.
I was told that it would probably be late January or early February
before my license arrived.

Will I be a new Tech or an old Tech? My guess is old, since I passed
the 5 wpm code test. If it did come in as new Tech, I do have the
certificate they gave me stating that I passed 5 wpm CW; that would let
me upgrade to HF privs right away, right?

Somebody please tell me that I will indeed get to operate on HF.

>

Welcome to amateur radio!

My opinions (worth slightly more than you paid for them):

- Don't worry about 'analog' displays of frequency. The digital
are quite good and plenty fine enough resolution.
- I think the "major brands" are all OK: namely Kenwood, ICOM, Yaesu
(Ten Tec is probably OK too, but I don't have any experience with
them.) I tend to prefer Kenwood and ICOM over Yaesu, but I can't
really support that with hard data.
- It sounds to me like you may be price sensitive. If so, then
you should look around for a used rig. If so, that means you
should probably pay more attention to the condition of the rig
and the price than the particular bells and whistles.
- If you are not so price sensitive, then I would check out the
latest and greatest stuff, preferably at a local ham store.
- Consider the cost of the extras. With solid state output circuitry
(which virtually all the new rigs have) you will probably need
an antenna tuner. You will need a power supply, CW filter,
maybe a desk mic. All this stuff adds up -- on a used deal it
may get thrown in at low cost.
- I think you are on the right track with antennas. Put up a dipole
or something to get you started. Low cost, reasonable performance.

Send me some E-mail if you have more questions.

I have not used parallel line for transmitting purposes.
But don't you think that it would be a mistake to run any antenna conductor or open-wire feedline that close to a metallic object?
I would think that it should be a min of 1 inch away from any metal (pref. 1.5 in.) and that there should be no metal between the conductors in the parallel line.

Why don't you install a thru-wall bushing, make a hole in a plastic window pane, or in a piece of lumber cut to size, and placed in the bottom of the window frame. Any open areas should be insulated with foam.
The window should be secured so that burglers cannot enter, but people can exit safely in case of an emergency.

>space for details!

Once the FCC gets the official Report and Order out, we can see what the
official status is, with rule change text and all. Check the Federal
Register next week or so.

I am still curious what the effective date will be. 30 days lead time is
typical, but not absolute. Making the effective date be Jan 1 would be
convenient for identifying "early Techs" vs "late Techs" by just the year
number on the license.

WHile the VEC's will be giving fewer code tests, they could very soon be
giving more written tests.

Well, maybe this only happens in QST magazine, but I read an article about a man who was on a boat and had an emergency. All he had was a CB, and the microphone was messed up -- no audio. He was lucky enough to contact someone who could copy morse code, and got help fairly quickly.

Of course, for every situation like this, there's probably 100 more where the guy is in trouble and doesn't have a radio at all because he never got his license because he didn't want to learn the code!

What I personally like about CW is that the hams that you bump into are nice. Very nice. Even the american ones. Try it, it's really FB man!

Over here in Europe, ham radio got the chop rather quickly when WWII broke out (some countries banned ham radio - except under the supervision of members of certain political parties - *way* before WWII actually began).
Once the War broke out, most of the hams were drafted in any case (in the UK there was a 'volunteer reserve' scheme under which hams were encouraged to register their skills, and when the war broke out, this reserve of skilled telegraphists, VHF/UHF experts etc. were just what the Military ordered....)
Anyone who is interested in some of the stuff British and Polish hams did during WWII should read 'The Secret War' by Brian Johnson (BBC Publications); a rather technical book full of pictures of AR88's and S27's and HROs.
In some countries, ham gear was actually impounded by the relevant national administration, presumably so it would not be used by spies (sorry, Special Operations Executives).

Pete Lucas G6WBJ G6WBJ@GB7SDN.GBR.EU PJML@UK.AC.NWL.IA 0793-411613

(p.s. i am not old enough to remember the above actually happening, but my father spent WWII polishing 807's and 813's in the service of his country).

Actually the press release covers all that too.

Interestingly enough, has anyone else come to the realization that we now have three DIFFERENT technician Class license holders, with the only proof of your priviledges being the date you took the test.

Make sure you keep those original licenses, especially if you are one of the older ones who took the General Exam and 5 WPM CW.

>drilling two holes right through the wall and using like #12 wire to
>go through the holes. Any better ideas?

Don't put anything lossy (like a wall) between the two conductors.
That's where the electromagnetic field is. I use two #12 teflon-jacketed
wires, close spaced so that their insulations are touching, to bring
open wire feeders into the house through a small hole. Sure it's a bump
in the line, the impedance changing from 600 ohms to say 100 ohms, but
it really doesn't matter. The whole point of open wire is that the losses
are so low that high SWR doesn't matter. The bump created by going from
600 ohms to 100 ohms is probably less than the mismatch between the
antenna and the 600 ohm stuff at the feedpoint.

From: magid@esis.enet.dec.com
Message-ID: <18184@shlump.nac.dec.com>
Source record: 5482

While I am a member of the league and have supported a good number of their proposals I wonder if they are really representing the needs and desires of the Amateur community.

Here is the track record:

1. 220 --- the FCC wins but may in time give us 216-220 plus 222 +

2. NPRM 90-55 the only thing the league got us was the ability to hold on to the novice class. (I supported the FCC here)

3. On the code waiver for the handicapped the FCC did it their way leaving the league out in the cold.

I think the ARRL needs to begin to hear the amateur community a little better and as well we need to be more vocal to the ARRL about our desires.

Take a low power air rifle (or a pea shooter) and shoot two BB holes the right distance apart in the middle of the nearest window. After fishing the wires through, seal with silicone putty.

I thought he was joking. Then I thought some more and that is actually a good idea. That way when you move out its about $5 for a new pane.

Except that I have storm windows. Certainly an idea to consider, thanks.

4101. morse code

Newsgroup: rec.ham-radio
Date: 1990-12-14 14:58:27 UTC
From: szarekw@lonexc.radc.af.mil
Message-ID: <1990Dec14.145827.14942@lonex.radc.af.mil>
Source record: 5590

first an intelligent response to Shailendra Anant Save:

Many of us like code. Sure it is an old way to transmit information but
code operators are very polite. Sometimes that can be very refreshing in
light of the chaos on 20 and 80 meters. Not all cw nuts are old farts either.
I became a ham in May 1990. This was just around field day. I spent 24
hours hammering at the paddles the best I could running the KB2KKH novice
station for the WF2L (MOARC/GARC) team. I fell in love with code. I went
from novice to extra in the 6 months because I simply loved the code. Simply
put people use cw because they enjoy using cw just like people who use other
modes use them because they are fun. That is what ham radio is all about
F U N (occasionally the technological state-of-the-art is advanced but that
is fun too!).

Now so I don't open a can of worms [yet :-)]. Here are my ideas about licencing.
If someone is happy with the privliges granted their class of licence then
great. Just because some classes have access to more bandwith than others
does not make them "better" than other hams. If someone desires privlages
that belong to a certain class licence than they should work for the new
licence to get the privlages.

Unfortunately some people feel they must get an extra call for reasons of
enhancing their self-importance. These are often the same people who belittle
other hams who enjoy hamming and have no desire to run high speed code, etc.
All an extra ticket does for you is allow you to be a VE, operate in space
(funny, if you are an astronaut and a ham they waiver the extra class requirement
to let you operate in space but, if you are an extra they won't waiver the
astronaut requirement and let you on the shuttle! life is so unfair! ;-),
and have access to a kc or so more bandwidth. Half of this added bandwidth
is in the cw bands so those of us who like cw can run cw at high speeds.
This is not exclusionary on a caste system, high speed cw is very different
from slow speed cw and I like to know that there is a place in the bands
that I can go to be challenged by good (no lids) operators who run 20+wpm.
This is not something special, it is just a small portion of the band set aside
for a particular mode. I guess I don't know what all the fuss is about.
General class ops have voice privs on all bands so what's the big deal?

IMHO i dont know why advanced and extras have additional portions of the
phone bands, i believe they should be open to everybody. (I admit it is
nice to have a quiet corner to rag chew though when I do run phone :-})
The cw bands should be left as they are so that depending on your ability,
and/or desire you can choose the appropriate portion of the band to operate.
It is just as frustrating to a high speed cw op to try to work someone sending
slow code as it is for a novice to work some lid who insists on sending 15
wpm cuz he doesn't know how to slow down his keyer!

****
**** WARNING FLAME ON *******
****

Dear Mr. Spencer

Your comments regarding my favorite part of this wonderful hobby were not appreciated. Such slander serves no purpose except to segregate the already dwindling and politically impotent ham radio fraternity (es sorority :-). Frustration of the magnitude desplayed in your 14 Dec 90 posting is quite in error. I will now disembowel your arguements one by one. Try not to read this to fast so you don't misunderstand a single word.

"For conformance with antiquated requlations" This is not a reason why we use code. It is not REQUIRED that we use code so clearly REGULATIONS are not why we USE code.

"Because they're old-fashioned" I am not old fashioned. I am 27 years old, hold a masters degree, run a farm, waterski, surf, hanglide, ride a harley, hunt, fish, hike, bicycle, dance, sing, and party. Clearly not the profile of an OF.

"because they're stranded on a desert island which is well-supplied with analog electronic parts but has no digital parts." Very good old boy, i almost missed your subtle sense of humor. I wasn't sure, for a min., that you knew that phone transmitters need analog parts more than cw transmitters do. QRP CW rigs can be made that use a nand gate as the final amp! cant do that with phone. Hmmmm, cant do that with packet, need analog there too . . . even funnier still good show!

"Morse is basically obsolete, since digital modulation techniques are far superior at punching clean signals trough noise" Sorry, here you are simply wrong. I suppose you could argue speed but not punching through. I have never seen a qrp (really qrp not 5 watts) rig that could successfully punch through a paper bag using "digital modulation techniques". However I do recall a QST article featuring a guy who got WAS on a qrp rig that used a nand gate for the final (i think it was something like .1mW output). No insult intended.

****
******* flame off ******
****

Sorry if this wasn't much of a "flame" but like I said CW ops are very polite.

It's fun. There's no particular PRACTICAL reason any more other than it's VERY economical. Try it; you might like it. If not, then you at least learned a little about communications history. In any event, thank heavens it's finally a question of personal preference.

well Paul, I will not enter the debate on souls, but, to add a little
to what you have said (I hope)...

and maybe add to the effort to answer Shailendra's question...

1) its fun
2) it is far easier to construct a transmitter for cw than afsk or ssb
and sonewhat easier than fsk... cheaper too...

3) more people homebrew low power rigs to play with that are cw
4) because of the Q codes, and no accent, it is easy to have a basic
no frills contact containing such info as call signs, names, locations,
signal strength, greetings, etc. without knowing each other's language.

of course, that could be done with Q codes on rtty, but it takes a larger
amount of money.

Being an old fart, when I got started (pre ssb days) cw was a way for me
to be able to afford a rig I could build, and I guess the majic of communicat-
ions with someone far away was a big thrill, that maybe the tones of cw
added to the mystique of it...

with the new rule that was announced yesterday, I guess the NEED has dropped
for VHF and up...

cheers
DFR

Silly me, Henry, all this time of being an old fart, I thought cw was the
first digital (on and off, modulated by keying) modulation technique...
and as far as punching signals through the noise, you will find it hard
to beat (without the military budget) that active filter most humans have
between the ears, occupying the cranial cavity.

hmmm, where did I go wrong all those years???

cheers!

At a much higher cost. It will be a looooong time before CW stops being the
best bang for the buck.

Hold the phone (pun???).

I thought that CW *is* a digital mode.

BNF:
<tone> := true;
<silence> := false;

Now, some digital modes are certainly superior to others, and some are
more suited for usage in high-noise (QRM) radio circuits than others.
Let's not confuse the issue by branding CW as an *ANALOG* mode, especially
since most digital modes in use today on UHF and below are merely digitally
modulated analog signals, like CW.

If you are branding morse as obsolete because of the modulation techniques
then HF packet, AMTOR, and RTTY are also obsolete.

>
> 73's
> Bob N4HY

Yes! I agree wholeheartedly. The SABM/UA and receipt of the I frame
with your QSO # should be enough.

I too connected, got a QSO number, but suspect my ack wasn't received.
This was on the second to last orbit, so I never saw a QSL list.
It was a real rush to see "CONNECTED TO WA4SIR".

I'll go one step further - with all the stations trying, why not save
the QRZ list and QSL *BOTH* the heard stations and the completed QSO
stations - with an indication on the QSL card whether you were just
heard or completed a QSO.

Oh maybe one more thing - how about an external antenna on that robot
arm or something? :-) I missed a lot of should-have-been-great passes
apparently because of shuttle/antenna orientation.

}receipt if you specifically asked for it at the time of renewal.
}
}In the end I found it so easy to get a US license that I just went ahead
}and did it.
}
I ran into the same thing with a Canadian licence many years ago. THe Canadian DOC would not accept payment before Jan 1 for a renewal starting April 1, usually I would get the renewal back in March and be off the air from April 1 through early May when my new permit would come through.

With Canada the reciprocal permit is automatic now, but I suspect that you could well end up with much the same situation.

BTW the reciprocal permit is NOT intented for a permanent resident even though the FCC normally won't bother with this. If you change your visa to "permanent resident" then you SHOULD get a U.S. license!

Source record: 5603
Cross-posted to: sci.electronics,rec.ham-radio

I almost hate to ask about this, but would someone please e-mail me a rundown of the "Herbie" situation? I listened in yesterday on 14.313. I heard Herb loud and clear; he seems to have a magnificent station. However, what I heard was a rational, reasonable man trying to enjoying chatting with other hams. He and his buddies were polite about letting other people join in.

What I also heard was hundreds of absolute jerks trying to shut Herb down via massive QRM (a violation of FCC regulations). Some of them were singing (which is also a violation of the regs). Many used foul language (yet another violation of the regs).

Then I tuned up a few kHz and heard an equally rational and reasonable sounding gentleman telling someone else that Herb had long since worn out his welcome. Unfortunately, he didn't elaborate enough for me to figure the situation out.

Please, I'm terribly curious. Obviously there are a lot of hams out there that ABSOLUTELY DESPISE Herb. I heard them myself. What is Herb supposed to have done to P.O. these people so much? I didn't hear anything bad. I don't understand why the people that don't like to listen to him can't just tune over to another frequency. After all, there's plenty of room for all of us. I thought we worried about not having enough hams, right?

Any elucidation will be greatly appreciated.

Message-ID: <12269@hubcap.clemson.edu>
Source record: 5604
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

In the book "Your Gateway to Packet Radio", in a chapter discussing the use of packet radio for public service communications and emergency communications in particular, it mentions a piece of software called ARES/Data. The Clemson University ARC is interested in utilizing packet radio for emergency and public-service work, which is what the software is designed for.

According to the book, it states that it (ARES/Data) is copyrighted but public domain and available without charge. Is it available from an FTP site, by any chance?? Are there any other sources for the software that anyone knows?

Also, it book mentions that to use the ARES/Data program, you need the TNC to have the WA8DED firmware installed. Where is THIS available from? (I can burn the EEPROM, if I can get the code, or is it not public domain?).

Thanks for the help!!

(BTW, this section of the book mentions a familiar name to readers of these groups... N6BIS, Patty Winter! Okay, Patty... help!!!!!)

Well, I too agree that the fcc has finally come up with an elegant solution.
Of course, I think there may be some problems to work out. For instance,
in the call book will their be any kind of designator indicating technician
prior to no-code vs. after no-code ?

And, if we are supposed to be self policing, and I hear a technician talking
on 10 meters, how do I know if he is legal or not ???

Well, it's a done deal, all we can do know is try to work it into our hobby
as best we can.

>
>BNF:
><tone> := true;
><silence> := false;
>

Depends on what you call digital. Actually, time is part of the
BNF (dot = 3 * dash, etc). Time is also quantized, so it is digital
in the true sense, just NOT binary. The BNF would be:

dot := tone-for-dot-interval
no-dot := silence-for-dot-interval
dash := dot dot dot
intra-letter-space := no-dot
no-dash := no-dot no-dot no-dot
inter-letter-space := no-dash
? inter-wordspace := no-dash no-dash no-dash

I'm sure the space between dots and dashes is one dot time, and
the spaces between letters is one dash, and three dot times are
one dash time. I'm not sure about the space between words, or
if there even is one defined (I think you may just parse the
letter stream into words by context alone).

>Should it ONLY be 110 to 120 VAC?

In a previous life I worked for a company that made electronic instrumentation for utility companies and became aware of a number of apparent anomalies in the way power companies treat measurements. In general there are good historic reasons if you dig deep enough, and one reason utility companies resist a move to more electronic instrumentation is that it tends to give measurements more "scientifically correct" but not of "the traditional form". No-one likes discrepancies, least of all people spending money (especially other people's money).
Well, first off domestic tariff electricity service in the US is nearly always based on a nominal 120volt supply. The most common service is so-called "110/220volt three wire" service (really 120-0-120 nominal). There are exceptions, the most famous (?) being Con-Ed's so-called 110/208volt network service which is the norm in New York City.
There are no universal standards on voltage tolerance and regulation, prior to the Mid-1970s it was common for whole towns to be run on substantial excess voltage so that a couple of far out ranches would not have too low a voltage at their end of the line. Marginally tapped transformers were one of the most successful approaches to better tolerance but the motivation was conservation. Before the energy crises utility companies had little incentive to conserve energy. Higher voltage meant more power sold, more power sold meant more fiscal turnover and more turnover meant more profit since the rate of return on capital was fixed by the PUC. In the modern age where it is just about impossible to build (let alone profitably build) a new power station, they have a large incentive to match demand to (limited) capacity.
(Anyone care to speculate what's going to happen when the US runs out

of sufficient generating capacity - as it certainly will ?)
There are other oddities, for example traditional induction disk power meters (like you probably have on your home), have a tendency to creep, i.e. record finite but small power when the voltage is present but the delivered current is zero. Although negligible in the grand scheme of things this fault would be very noticeable so to overcome it the induction disks are made with a smallish hole in the disk to prevent creep. A consequence of the anti-creep hole is that a finite starting torque is needed to get the meter started (typically equivalent to 15watts of power). Another anomaly is the limited harmonic response of the induction disk meter, this tends to make harmonic rich loads (notable fluorescent lights) appear to consume less power than they actually do. Utility companies definitely want to hush this up because commercial users are the big users of this type of load, and they are good business being cheaper to supply and paying a higher tariff than the domestic consumers (remember the PUC (Public Utilities Commission) sets the rates). So the Utilities resist more "scientifically accurate" instrumentation as it would remove a well-hidden break that the commercial users are getting.
Another anomaly affects only service greater than 200Amp (not your domestic service) and that is that above 200Amps current transformers are usually used as part of the instrument, and guess what, current transformers saturate and go distinctly non-linear if there is any D.C. component in the load current. How can this be? Easy - just have your pottery factory run its kilns as half wave loads and see the power bill decimated. Again suitable electronic instrumentation would be "scientifically accurate".

We also made QRZ at W6YX. We have third party confirmation. But, given the Doppler, one could make an actual connect only at maximum elevation (at least at our latitude), and since the robot heard us before that time, there was no way we could ACK it.

The robot is the proverbial Good Idea, since it allows for continuous coverage (even while the ham astronaut is doing real work). But yeah, the logger could use a little bit of work...

Could someone send me the circuit for the ROBOCOPY program that
was published in the October issue of _73_ Magazine. I have
the program which is intended to decode cw from the reciever
speaker input, but don't have the circuit schematic. I will also
need the pinouts for the serial port (25 pin and 9 pin).

The circuit is only like 2 transistors and a few other parts.
The parts list was included with the .zip file, but no schematic.

Thanks in advance.

Mike

For all you types experimenting with mobile CW the sideswiper type keys are (IMHO) the ONLY hardware worth considering. The use of keyers with memory are ok for the canned portions of the QSO but when you have to start talking then its time to get off the keyer. Keyers require more concentration than do manual keys. The motion with a straight key is not natural in any mobile mounting position. Mechanical bugs require a lot of concentration and suffer from bump-jitters on the dot contact. The sidewinder has a nice lateral movment, a positive control pivot that does not bounce and is self centering. Overall, its your character that comes out in the sending and can be very pleasing to the listener.

Try one, you'll like it.

Haven't you ever had the +audio or ground leads break off inside a 4- or 8-pin mic connector while the 2 PTT leads were still intact? I'd say it's happened to me about 5 or 6 times in the last few years.

Reminds me of the time some lid dropped my portable PC being used for logging right in the middle of field day. A la Murphy, it's bound to happen at the worst possible time.

You will be neither an old nor a new Tech. You will be a middle Tech.

Old tech's are those who passed the General theory exam, and need only a 13 wpm code test to become General.

Middle tech's will be those who passed the Tech theory test and the 5 wpm test. They will have, according to the info passed here, Novice HF and all other VHF+ privs. They will need a General theory test AND 13 wpm to make General. (Or, will the more intense new tech test qualify for the general theory test?)

New tech's will pass a new theory test. They get VHF+ privs.

> Somebody please tell me that I will indeed get to operate on HF.

It isn't up to us. It is up to the FCC. They seem to be saying "YES".

BJ--

The public service column of the December _QST_ is devoted to ARES/Data.
It gives instructions on how to obtain it by mail, CompuServe, or BBS.

By the way, someone once pointed out to me that the terms "copyrighted"
and "public domain" are mutually exclusive. Like Phil Karn's NET and
NOS programs, ARES/Data is free to its intended audience, but is not
public domain.

>Also, it book mentions that to use the ARES/Data program, you need the

Well, I went by what the book written by Stan Horzepa (WA1LOU) said:

"It [ARES/Data] is a copyrighted, public-domain program, available
without charge to anyone interested."

Personally, I agree with your statement, but I wasn't sure if it was
truly copyrighted or really public-domain, so I went for inaccurately
vague mode :-)

>
>>Also, it book mentions that to use the ARES/Data program, you need the

Well, the book mentions "a set of... packet-radio guidelines and public-
service events were compiled by Patty Winter, N6BIS, in 1986... An
expanded version of these quidelines follows." Then it goes into what
would be a little over two pages worth of hints and guidelines. It was
very informative.

Overall, I really like the book. BTW, this is the 2nd edition to which
I refer...

>
> p.s. Don't anyone bother asking me more about ARES/Data. I've seen it

It would be worthwhile if someone could upload ARES/Data to a well-known archive site. People would then be able to get it via anonymous ftp.

If this has been done, which host has it?

I disagree. People think that there is something magic in DSP (Digital
Signal Processing), but it really is nothing more than fancy filtering.
The human ear/brain is also a pretty fancy adaptive filter, and it can
"fill in" missing text based on higher-level reasoning that would be
impossible for a computer. For sending human-readable text at
slow conversational (rag-chew) speeds over narrow bandwidth channels,
CW is unmatched. It also has the advantage of simple, inexpensive
equipment.

From: sawyer@twg.com
Message-ID: <8444@gollum.twg.com>
Source record: 5490

Well, I've been waiting all morning for the crowing to start and so far the wires are silent. The only explanation I have is that the word hasn't gotten out yet. So...for those of you who haven't heard yet...

Yesterday, 13 December, the FCC formally approved a new class of no-code license. The ruling will take effect in approximately 60 days. The basic outline is as follows:
- the name of the new class of license is "Technician";
- call signs to be issued from the same class as current Novice licenses (the 2 x 3 block);
- examination requirements are the current written elements 2 and 3a only;
- examinations will be administered under the current VE program;
- the new license will grant all amateur privileges above 30 MHz.;
- upon completing a 5 wpm code exam, the new Technician will obtain the same privileges as the current Technician class licensees.

Further details on administering the program are still being worked out. All of the 18 VEC's are now conferring with the Private Radio Branch of the FCC to set up the administrative procedures for handling this.

I had expected to see this in the ARRL bulletins this morning (Friday, Dec. 14) but nothing showed up. It's a good guess something will appear about it in Monday's bulletin. FYI, my source on this is W6NLG, President of the Sunnyvale (Ca.) VEC, as communicated directly to him by John B. Johnston, Chief of the Private Radio Branch at the FCC. Cheers.

>since most digital modes in use today on UHF and below are merely digitally
>modulated analog signals, like CW.

Branding CW as a "digital mode" is sort of like calling a bicycle an
automobile because it has wheels. While the symbols take on discrete levels,
both the encoding process and the decoding process are very analog in
nature.

>If you are branding morse as obsolete because of the modulation techniques
>then HF packet, AMTOR, and RTTY are also obsolete.

The problem here is that you're confusing coding with modulation. HF packet
et al are all FM in nature, which is somewhat superior to AM modes like CW
when it comes to decoding (orthogonality).

Old tech myths die hard...

For years I've been trying to tell anyone who will listen that connected-mode AX.25 is very ill-suited for "contesting" purposes. Unfortunately, the Sarex missions seem to place a very heavy emphasis on Joe and Mary HT being able to participate with no special knowledge, equipment or protocols, even though this wastes a golden opportunity to encourage Joe and Mary HT to try something new. and even though this results in absolute bedlam on the bands.

Anyway, what you really want is a simple three-way handshake. Station A sends a CQ with a sequence number. Station B responds by acking the Station A's transmission and including a sequence number of its own. Station A then acknowledges station B's transmission and goes back to calling CQ. That's it!

There is, by the way, NO protocol that will *always* ensure that two stations communicating over a lossy network will agree on whether or not they had a successful QSO. This is known as the "two-army problem" (aka the "coordinating generals' problem") and it is easily shown to have no solution. See Computer Networks by Tanenbaum, second edition, p397-398.

Phil

4139. Need Circuit for _73_ Magazine ROBOCOPY program

Newsgroup: rec.ham-radio
Date: 1990-12-14 23:23:18 UTC
From: mikef@bert.Rosemount.COM
Message-ID: <9498@rosevax.Rosemount.COM>
Source record: 5499
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Could someone send me the circuit for the ROBOCOPY program that
was published in the October issue of _73_ Magazine. I have
the program which is intended to decode cw from the reciever
speaker input, but don't have the circuit schematic. I will also
need the pinouts for the serial port (25 pin and 9 pin).

The circuit is only like 2 transistors and a few other parts.
The parts list was included with the .zip file, but no schematic.

Thanks in advance.

Mike WA0VNH

+Yes but I wonder how long it will be before some ham sues on the basis of
+reverse discrimination or some such thing as this. If an exception is made
+for a certain group, the death of the requirement cannot be far behind it
+would seem to me.,
+
Better yet, a class action lawsuit! Since current TECH license holders are
a greater that 51% majority of all grades of licensees, it would seem only
logical that the 13 WPM requirement be DROPPED! And that all licensees that
have credit for Elements 3a&b be grandfathered General privs. The same should
apply to Advanced licensees that can pass Element 4b. Face it, CW's an artform
not an absolute standard of merit or measure! And it's days are numbered...!

I don't think so. With this logic, I could go around installing wireless burglar alarm systems that used ham radio frequencies, and claim that it was all legal because it was emergency communications.

Additional footnote. From (i forget) but probably a WWII vintage Radio Amateurs Handbook (they kept printing em...), there were articles on LF License Free ops and "wired wireless" (power line propagated LF.) I have no idea if these were actually used. I seem to recall that in certain areas (near military bases, ferinstance) even these were forbidden.

The Yaesu numbers are 757 and 767. I'm considering the 757 as my second rig, which is the cheapest of all of the above numbers.

The other school on this says to spend as little as possible on your first rig, see what annoys you the most, then trade for something that doesn't annoy you. I bought a Kenwood TS520 for ~$350 (less than most HTs), and have had a great time with it. The 520 has discrete transistors, 3 transmitting tubes, analog dial, and no synthesizer.

Curiously, Ten-Tec offers two versions of their top-of-the-line, one that is synthesized, and one that is not. I think the Paragon is the one for those people that are fed up with synthesizer birdies.

I agree with the comment about using CW. It is definitely illegal to modify
a ham rig to operate on CB as the radio is not type-accepted for that service.

AL N1AL

This is a good question for all the net-lawyers.

Is it illegal to modify a rig to RECEIVE CB?

Is it really illegal to modify a rig to make it capable of transmitting on the
CB band? There's no question that it's against the rules to transmit with
it. Is the mere ownership of a non-type accepted CB rig illegal?

Re: running twinlead down the exterior wall and into the house

When I installed some twinlead, I just nailed it to the side of the house with 1" box-type nails. To bring it inside, I drilled a line of closely-space holes, then joined all the holes into a slot by twisting the drill sideways. To keep the bugs out, I then used silicone caulk around to drilled slot.

I haven't started any fires... yet. :)

Re: No-Code license

Now that it's here, we must learn to live with it. I understand that there will be 2 classes of Technicians: one who has passed 5WPM and has all current Tech privileges; and one who has not demonstrated the Morse code ability, and is restricted to 30 Mhz and above. I also understand that there will be no call-sign differentiation. So how will we bge able to tell if a Tech who is operating below 30 MHz is authorized to do so?

It is published every week and is made available for unlimited distribution.

* MIR NEWS *
============
U2MIR has once again become active from the Mir space station complex.
Simplex radio contacts with U2MIR can be made on a frequency of 145.550 MHz
FM when the amateur radio experiment is active and the spacecraft is above
your horizon. U2MIR was supposed to contact WA4SIR on the Space Shuttle
(STS-35), but due to Columbia's early return to Earth, the contact was
never established.

* OSCAR-21 NEWS *
=================
The launch of AMSAT-OSCAR-21/RM-1/RS-14/RUDAK-2 has been postponed until
07-Jan-91 so that a Soviet official may witness the launch.

RUDAK-2 will not only carry a Mode B linear transponder, but also a variety
of packet radio experiments with data rates from 400 to 9600 bps using
various modulation schemes. It will be compatible with AX.25 protocols
and those amateurs equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry,
and UO-14.

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
O/P Power: 12 watts max.
Beacon : 145.880 MHz, CW telemetry.

Gain of satellite RX/TX antennas: 2.3 dBi each (dipoles)
Input sensitivity: -125 dBm (435 MHz) for a C/No of 45 dB/Hz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) +Scrambler

SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc. (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow
and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

> Newsgroups: rec.ham-radio
>
> I have not used parallel line for transmitting purposes.

Works very well. FOUR conductor parallel line works even better. Commonplace (once upon a time) at commercial installations for very long transmission line runs.

> But don't you think that it would be a mistake to run any antenna
> conductor or
> open-wire feedline that close to a metallic object?
> I would think that it should be a min of 1 inch away from any metal
> (pref.
> 1.5 in.)

1 or 1.5 inches can be tolerated for metal running at right angles to the line. For metallic conductors running parallel to the line 6 inch separation would be an ABSOLUTE minimum.

Another tip: avoid sharp bends in the line. Circular bends at least 1/20 waveength long at the lowest frequency should be used.

>dwindling and politically impotent ham radio fraternity (es sorority :-).

Lighten up, Bill. The no-code battle is over, and the no-code license proponents won. This does not mean that the pro-code proponents lost. Those who like code are perfectly free to continue using it. (This even includes me from time to time.) Your overreaction to Henry's gentle ribbing reminds me of Shakespeare's line "methinks thou dost protest too much."

>"because they're stranded on a desert island which is well-supplied with
>analog electronic parts but has no digital parts." Very good old boy, i almost
>missed your subtle sense of humor. I wasn't sure, for a min., that you knew

>QRP CW rigs can be made that use a nand gate as the final amp! cant do that
>with phone. Hmmmm, cant do that with packet, need analog there too . . .
>even funnier still good show!

Are there no new arguments under the sun? Sigh. To paraphrase my reply comments on 90-55, how come you guys only mention the simplicity of the CW *transmitter*? It seems to me that a workable CW *receiver* is quite a bit more complex than the simplest AM receiver, the crystal set.

>"Morse is basically obsolete, since digital modulation techniques are far

>recall a QST article featuring a guy who got WAS on a qrp rig that used a
>nand gate for the final (i think it was something like .1mW output). No
>insult intended.

This argument is also answered in detail in my reply filing, and Bill, *you* are simply wrong. Rather than repeat the entire thing here, I refer you to it. Suffice to say that CW, as it is generally used in amateur radio (on-off keying of a carrier) is *extraordinarily* inefficient in terms of both bandwidth and power. Many computer-oriented digital transmission techniques exist that are far more efficient than manual CW, and some of them are even in use by amateurs. (This is not to say that these techniques don't also have a

lot of room for improvement - they do.)

From: Benn Kobb KC5CW 75676,1705
To: ALL

The FCC today rejected the Communicator Class no-code amateur license proposal. Instead, it deleted the Morse code requirement from the Technician license. The vote was 5-0.

The full text of the Commission decision has not been released. It is expected in a few days or weeks. Only the News Release is available.

Here is the text of the FCC News Release, Dec. 13, 1990:

Reply: #35303 (3 replies)

NO-CODE TECHNICIAN CLASS AMATEUR RADIO LICENSE Q&A (Based on FCC info)

Q: How does the "new" Technician obtain HF privileges (below 30 MHz)? A: By passing a 5 WPM Morse code test. The Volunteer Examiner (VE) will award a Certificate of Successful Completion of Examination (CSCE) and will notify the FCC that the Technician has completed the Morse test. This CSCE will be valid for life. No new license or callsign will be issued.

Q: Will the "HF" Technician have to identify in any special way? A: No. The FCC decided not to require a suffix or any other special ID for Technicians, whether or not they have passed 5 WPM. The regular callsign system will continue in effect. The only indicator that one has HF privileges will be the CSCE and the name on file at the VE Coordinator and FCC.

Q: I already have a Technician license. Does anything change for me? A: No. You will keep all current privileges including your HF privileges.

Q: The FCC proposed to get rid of Novice Class. Did this happen? A: No. Novice will remain as is.

Q: How many questions will there be on the Technician written test? A: Fifty-five. The FCC decided not to require extra written questions about the "utility and tradition" of Morse code.

Q: When will the "New" Technician license be available? A: By February, according to FCC staff.

Q: Why did the FCC do this? A: "The Amateur Service is not growing to the extent it probably should, based on what it has to offer. One of the reasons we think that providing a non-code entry will be helpful is that it will get people, particularly young people who have a primary interest in digital communications and computers, interested in this service." - Private Radio Bureau chief Ralph Haller, N4RH

In article <8444@gollum.twg.com> sawyer@twg.com (Bruce B. Sawyer) writes about a conversation with the president of the Sunnyvale (CA) VEC who spoke directly to John Johnson of the Personal Radio Division of the FCC:

> - call signs to be issued from the same class as current Novice licenses
> (the 2 x 3 block);

Did he really say this? Or did he say that it's true in 6-land where there are no more N6 calls available?

>Monday's bulletin. FYI, my source on this is W6NLG, President of the Sunnyvale
>(Ca.) VEC, as communicated directly to him by John B. Johnston, Chief of the
>Private Radio Branch at the FCC. Cheers.
> AA6KX

You know, I got my first info from the Sunnyvale VEC's recorder and thought I was hearing more than in the FCC's press release reprinted here. Apparently this is why.

One other thing that Sunnyvale stated, which was not in thepress release was that testing was expected to begin on 15 February 91. The date was specific.

Howdy

I was wondering if anyone knew where I might find a ckt diagram
or plans for a homebrew 2m FM rig. I mainly would like to build
something to use a local repeater, so it should be able to do a
rcv/xmt shift and put out at least 5W running off 12V. Rock bound
is fine, since I just need to hit the one machine, but I wouldn't
complain if it was tunable - as long as it is stable, since the
rig is meant for mobile operation. I want to do this because I
need a knock-around rig for the car (using the HT mobile is a
pain) and because I like the smell of solder. However, if this
would be too expensive, I'll probably pick up an old rock bound
mobile rig at a swap meet instead.

I would prefer sources you know have such a circuit rather than
'I think X might have something like that.' I looked in my copy
of the ARRL Handbook and all the 2M stuff seems to be transverters
for an HF rig. Does anyone know if the 1991 Handbook has anything
new in this area?

Please reply via e-mail. I _DO_ read this newsgroup, but I don't
know if this subject has a wide appeal. If you think it does ...

Regarding Photo Radar -
A similar scheme was tried about 20 years ago in Arlington, Tx
(between Dallas and Fort Worth). There was a camera mounted on
a pole, and if you crossed two sensor wires in the pavement too
fast, it took a picture. This had only one major effect - since
it was stationary, everyone would speed like crazy until they got
up to the sensors, and then cram on the brakes. Lots of accidents
there because people who didn't know about the system weren't
expecting the guy in front to "panic" brake from 70 down to 50
in the middle of an open area.

Also, EVERY single weekend, someone would go out with a spray can
of black paint and opaque out the lens. (not that I would suggest
such a thing)...

> Why say UGH? CB out of the cities is a useful and fun personal communications
> system. Which is exactly what it's meant to be.

Several times a year I drive (more like commute) between Flagstaff Az, and Ouray, Co. I've found that once you get away from the interstates there is *nothing* even on CB. A VERY few times I've heard Navajo up on the reservation, but that's it.

Once you get a little further east, it's not so bad (like Texas :-))... This summer I made several trips between Flagstaff and Fort Worth. Was driving in towards Amarillo about 9 at night when I passed a van with a WB0... license plate. I have my WB5... plates on. I switch on the CB and sure enough there he is. We had a nice qso, although it was tough to remember not to use our callsigns. Turns out he was originally licensed in Denver, but was now living in Texas so he had what used to be called an "out of area" license plate. I was originally licensed in Dallas, so I have a my WB5... call on an "out of area" Colorado plate. We had a big chuckle over this. Things sure have gotten confused.

Well, I'm listening as best as I can, given a machine that's been sporadic in
receiving news the past week or two...

Tell you what. Come up with a name that describes the intended traffic as well
as .legal, and is more inclusive than .rules, .regs, or .regulations, and I'll
adopt it. Fair enough?

>is restricted to 30 Mhz and above. I also understand that there will be no
>call-sign differentiation. So how will we bge able to tell if a Tech who
>is operating below 30 MHz is authorized to do so?
>

You certainly can't do it by callsign for ANY license class. Can you
tell by my callsign whether I am authorized to operate on 7.018 MHz?

As someone else pointed out recently, even the callbook data comes
out too infrequently to use that as a judge of someone's license
class. So you will have a hard time immediately proving that anyone
is out of band, not just the new Technicians.

On a slightly different subject:
Has anybody ever heard of a case when someone has been cited for
out-of-band operation during a contest? I would think the nature
of the beast would make it unlikely.

Mine says neither rec.ham-radio nor rec.radio.amateur. It does use the
word "license". If what the license says is what we should use, then the
group name should be amateur.radio.license.

> >Law: If it ain't broke, don't fix it.
>
> This should be applied wherever possible. The problem is things are not
> right or there never would have been a call for reorganization.

The name is not broken. Don't fix it. The structure is broken. Fix that.
Changing the name is not chaging the structure.

> >Corollary: Even if it's broke, I like it that way.
> >
> This is a refuge for those without the initiative to make things better.

There is still no evidence that renaming the group will make it better.
Look up the word "ham". Look up the word "amateur". See which definition
talks about radio. See which one doesn't.

Bill Vodall writes:
| Is it illegal to modify a rig to RECEIVE CB?

No. My unmodified DX-440 (Shortwave Rec.) is not type accepted and
does receive CB.

| Is it really illegal to modify a rig to make it capable of
| transmitting on the CB band? Is the mere ownership of a non-type
| accepted CB rig illegal?

No. If it were, then it would be illegal to run ANYTHING with a 27MHz
crystal in it. Last I checked, it was legal for a ham to modify a
commercial amplifier (for personal use ONLY) such that it worked in
the 10m band. This sort of modification almost always results in
these amplifiers working in the CB band as well since the amp isn't
really all that picky about a megahertz here or there. Thus, most
hams who own 10m amps inadvertantly own CB amps.

It is illegal to transmit on the CB bands with non type accepted gear.
Also, a type accepted CB radio which has been modified for ham use is
no longer type accepted for use as a CB radio.

The long and short of it is this: if you want to have both a 10m
radio and a CB in your car like I do, you can either operate illegally
in the CB band or you can carry two radios. Given how cheap used CB
radios are, there is no monetary reason to not carry two rigs. Given
how small some cars are, there are lots of physical reasons. I
finally chose to mount a ham rig in the car and toss the CB on the
front seat when I really want/need to use it.

>"fill in" missing text based on higher-level reasoning that would be
>impossible for a computer.

DSP filters can operate over a much wider range of bandwidths than the
human ear/brain can. In particular, DSP filters can easily achieve bandwidths
much smaller than the 50 Hz figure that is typical of a trained CW operator.
This makes it possible for a DSP-based system to demodulate signals that
aren't even detectible by ear. Examples include N4HY's demodulation of
4 bps signals from the Soviet "Vega" balloon probe in the atmosphere of
Venus, and the N4HY/W3IWI DSP moonbounce experiment.

No, there's nothing magic in DSP. Nor is there anything magic about the
brain/ear combination when it comes to operating as a modem.

>For sending human-readable text at
>slow conversational (rag-chew) speeds over narrow bandwidth channels,
>CW is unmatched. It also has the advantage of simple, inexpensive
>equipment.

If by "human-readable text" you mean something that can be decoded
directly by the human ear/brain without any extra equipment, well, even
the best CW ops I know still require a receiver and antenna. :-)

As for CW being the only mode that can use simple, inexpensive equipment,
it depends on how you define those terms. Packet radio TNCs are fairly
simple and inexpensive by my standards, inasmuch as they are usually
smaller and cheaper than most receivers. And given the trends in digital
vs analog electronics, I expect that the cost-effectiveness of digital
communications equipment will continue to increase very rapidly.

4164. Technician Calls

Newsgroup: rec.ham-radio
Date: 1990-12-15 21:02:05 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9012152102.AA09128@cmr.ncsl.nist.gov>
Source record: 5524

Dube Todd asks how we will be able to tell the "with-code" Technicians from the "without-code" Technicians, given that there is no difference in the calls.

My answer: The same way you can tell that KA3XXX has an Extra license - you can't.

Maybe the FCC database will carry the w/code notation, but I rather doubt it. If the code status is in yet another database, it doesn't seem too likely that even the Callbook will merge the two.

I, for one, think that our present alphabetical zoo of call letters is mainly the result of a failed effort at "administrative neatness" involving an exquisitely graduated series of license grades, each with its own block of call letters. It all failed when hams were allowed to keep the same call when they upgraded. How many of you would like to go back to the old system where upgrading REQUIRED a new call?

>is restricted to 30 Mhz and above. I also understand that there will be no
>call-sign differentiation. So how will we bge able to tell if a Tech who
>is operating below 30 MHz is authorized to do so?

The trick is to realize that it doesn't matter. Clearly the FCC
doesn't care very much, or they would have come up with a way to tell.
If they don't care, why should you?
- Brian

PS: When is dube gonna go pound on whoever maintains his site's news
software so that it put the Subject: line into the header instead of the
body of the message? I mean, if he can't follow Usenet rules, why worry
about the FCC? Which, after all, is more important? :-)

In answer to myself ;) - there were informal suggestions at the time of the creation of the Technician that it be no code. The idea was promptly squelched by the League HQ fossils, thus making the word safe for telegraphers for all time. [:-)

Yeah! I am definately doing some of that here....no criticism of any
alternative views implied....it just seems like a murky area to me.
I have no problems with on-the-air repeater burglar alarms OR reverse
autopatches myself.

BUT....if you could justify the burglar alarm as an emergency transmission,
then that would allow you to use ham frequencies for ANY burglar alarms,
right?

>I disagree. People think that there is something magic in DSP (Digital
>Signal Processing), but it really is nothing more than fancy filtering.

Implementing FIR filters is only one component of DSP. Others include
convolutional codes, correlation, etc., which improve reception. In any
event, it's easier to build very steep filters with DSP.

>The human ear/brain is also a pretty fancy adaptive filter, and it can
>"fill in" missing text based on higher-level reasoning that would be
>impossible for a computer.

Again, this depends on the operator. A well trained operator can fill
in missing symbols. The symbol time for CW, however, is much shorter than
that for, say, human conversation; this is important in fading channels, where
you may lose all of a CW symbol, but only part of a phoneme.

> For sending human-readable text at
>slow conversational (rag-chew) speeds over narrow bandwidth channels,
>CW is unmatched.

Most CW ops that I've heard carrying on "real" conversations operate at
around 15 WPM. Compare that with normal human conversation at 150 WPM,
and you can see where the "advantage" of CW comes from -- slowing down
the information rate. I think if you were to compare a rate 1/10 PSK
system to CW, you'd notice the difference.

> It also has the advantage of simple, inexpensive
>equipment.

So did spark gap. Time and technology made CW nearly as inexpensive as spark,
and time will eventually do the same for DSP.

I have received the following (somewhat edited) replies. The comments
are very positive. I plan to purchase an R5 myself.
-Eric, KD3SP

From: "Stuart G. Phillips" <stu@suntan.tandem.com>

I have an R5 which I installed on my roof (approx 35' up) and used it
to replace a Butternut (to get rid of the radials). The antenna goes
together quickly and is well engineered. I've tried the antenna on the ground
and it works almost as well as on the roof.

It gets out just fine ! If I can hear them, I can work them assuming
opreating skill or comparable power.

Good luck
Stu N6TTO

From: Jeff Crilly N6ZFX <xanadu!jeff@uunet.UU.NET>

I have had one since august. I think its great. The swr bandwidth is real good.
Mine is at 20 feet above ground; I use a radio shack heavy duty tv mast
and tripod. I used it initally at 10 feet and it worked fine. The only
problem with it is that 20 through 10 is usually dead in the evening
when I operate, and I wish I had 40 and 80. Anyhow I am working on a
diopole for 80 to alleviate that problem. I think that the bandwidth is
wide because of the thick tubing they use.

The only alternative to this antenna is probably the isoloop for AEA and
that antenna just looks like a hassle to tune. Also the barkerson and
williams jobs are avaialble, but I think they are inefficent and have narrow
bandwidth.

Jeff Crilly (N6ZFX)
AMIX Corporation 2345 Yale Street Palo Alto, CA 94306
jeff@markets.amix.com, {uunet,sun}!markets!jeff, N6ZFX@N6IIU.#NOCAL.CA.USA

From: tom@ksr.com

I've had an R5 for about 6 months. I think that it's a fantastic
antenna. It's not a beam ... but it sure does get out well. On 10,
I'm told I am as loud as anybody else and have easily worked
everywhere on earth. It's almost as effective on 12, 15 and 17. It's
a little harder to break through a pileup on 20 but that's probably
because everyone else is using 1KW and I am using only 80 watts. Mine
is mounted on the roof of my house so I don't know if it would
interact with metal. (Either way, it's a hell of a lot easier to put
up that the 1/4 wave vertical that I had before with its ooodles of
radials).

Good Luck,

Tom

From: Jim Hollenback <holly@hpcupt1.cup.hp.com>

Eric,
I have had a R5 up for about 2 years now. Works fine, I have worked about
150 countries with it now. I do well in moderate pileups on Pacific island
stations and not to bad in Europe - can't beat the east coast boys if there
is a big pileup. Same goes for zone 8 if the 4's and 5's really want the
guy. But this should be no surprize. My R5 is mounted on 3 five foot masts
that are attached to the eave of the house. The base of the antenna is about
four feet off the eave. About six feet below the antenna is a metal fence.
I have good SWR on all bands (17 mtr sucks, but I have not installed the
new trap kit yet - mine started life as a R4 and I bought one of the first
upgrades. They sent me the new kit at NO CHARGE!)

My country count is pretty even between 10 and 20 mtrs, 15 is a little lower,
probably because I don't work that band as much. I have not worked 12 and
17 much, but 12 seems fine. I get honest 57's and 55's in Europe and the
South Pacific and Asia with 100 watts. Not sure what you mean about
efficiency, but the antenna seems to do the job.

Hope this helps,
Jim, WA6SDM
jholly@hpcupt1.cup.hp.com

From: Ken Mitchum <km@cs.pitt.edu>

I have had an R5 up for about a month, although I have not had too
much time with it on the air. It is up about 30 feet, is about 20
feet from a tree. I live in a fairly flat part of town (Point Breeze)
where there just isn't much room for any kind of antenna.

Running 100 watts out, I have had no trouble working whomever I heard.
This is mostly on Amtor and RTTY on both 20 and 10. I normally don't

pay attention to SSB, but I did notice the 10 meter JA contest one night and worked about 15 JA's in about 20 minutes.

The antenna is fairly quiet in terms of noise pickup, which surprised me a bit since I usually associate verticals with more of that. I have had no RF problems with computers, which I did have previously with a dipole. The antenna is a bit overpriced, and the hardware quality is not the best, particularly in terms of the mast mounting, but it certainly works well, and in my location is about the only thing I could easily put up.

>
>AL N1AL

It has GREAT advantages in simplicity (read cheap, light, compact, easy to build), but learning the code is simple for some and extaordinarily difficult for others. Even those who know the code VERY well are probably aware of how SLooooooW the conversation has to be in CW. Not quite rag-chew as rag-chew is on voice (or AMTOR or Packet); usually one shortens everything to accomodate the slow baud of CW. That is another thing that makes CW another language for the novice "CW op."
Full duplex voice ("phone") is "rag-chew" at its best! It is hardly a narrow bandwith setup, but can be inexpensive and compact as well (that's what modern technology does for you). I don't suggest that we implement this on crowded HF bands but, then, rag-chew can be done on VHF, UHF, SHF... with an HT, a mobile, or a satellite ground station.
When it is almost impossible to get through, and I want or need to get through, I will be the first to use CW. For moonbounce and rare DX it can work wonders! But when my ship is sinking, I will pick up the mike first, because very few amateurs are likely to bother tuning in my CW signal in order to hear that I'm transmitting SOS.
When I feel like using CW, I will. When I want to rag-chew, I'll use phone. When my ears get tired of the noisy HF bands and the pops and squeals, though, I'll move to UHF FM. There WAS enough space there for full duplex yesterday!
****
The problem with rag-chew is that they are really disgusting looking after you spit them out! :-)

For digital communications purposes, much better active filters can be, and already are, implemented in silicon at amateur prices. Ask some of the folks doing digital satellite communications with modern modulation techniques.

Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
or is it for the average ham?

Joe and Mary HT aren't going to be interested in buying new gear (a PSK
modem, for example, 1- isn't cheap, and 2- is a pain to get running) or
learning new software in order to be able to work the shuttle. Instead,
they'll complain loud and long about how those nasty AMSAT types aren't
interested in them, and, unlike the loud complaints about the low-
inclination orbits and Ron's operating hours, they'll have some basis in
fact.

You're right about the two-army problem, but the solution is not to exclude
the average ham.

| Middle tech's will be those who passed the Tech theory test and the 5 wpm
| test. They will have, according to the info passed here, Novice HF and all
| other VHF+ privs. They will need a General theory test AND 13 wpm to make
| General. (Or, will the more intense new tech test qualify for the general
| theory test?)
+---------------

Given that the Tech license will be an entry-level license (else, what's the point?), I strongly suspect that the theory test will be added to from the Novice question pool, not the General.

It wasn't clear to me from the ARRL bulletin whether upgrades from Novice to Tech-with-code-endorsement would take the new test or the 25-question test. If the new additions to the Tech test are from the Novice pool, then the old 25-question test [as opposed to the ancient 50-question test. OK?] may be retained for upgrades from Novice.

It may not be clear to the FCC at this point either. We'll just have to wait for it to hit the Federal Register, I guess.

13-Dec-90 14:40:14
Sb: NO-CODE IS HERE! [1]
Fm: Benn Kobb KC5CW 75676,1705
To: ALL

The FCC today rejected the Communicator Class no-code amateur license proposal. Instead, it deleted the Morse code requirement from the Technician license. The vote was 5-0.

The full text of the Commission decision has not been released. It is expected in a few days or weeks. Only the News Release is available.

Here is the text of the FCC News Release, Dec. 13, 1990:

* * *

ACTION IN DOCKET CASE

FCC ESTABLISHES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE (PR DOCKET 90-55)

The Commission has revised the examination requirement for the Technician Class operator license, thereby creating a new codeless class of amateur operator license. After these revisions become effective, an examinee will not be required to prove that he or she can send and receive texts in Morse code telegraph signals to qualify for a Technician Class amateur operator license.

The amateur service currently consists of five classes of licenses having increasing privileges and each being progressively more difficult to obtain. The classes are Novice, Technician, General, Advanced, and Amateur Extra.

The FCC noted that offering a codeless license class that authorizes control operator privileges at stations which transmit exclusively above 30 MHz, provides an entry level opportunity to otherwise qualified persons who find telegraph a barrier to pursuing the purposes of the amateur service.

Therefore, the FCC has established the Technician Class as the codeless class of license. This license includes all amateur privileges above 30 MHz. The Commission also amended the rules to grandfather frequency pr30 MHz to current Technician Class licenseeice Class operator license in order to provvice and who can pass a telegraphy requirement in place of the more comprehensive written examination requirement for the codeless Technician Class operator license.

4189. Re: 10 meter rig recommendation?

Newsgroup: rec.ham-radio
Date: 1990-12-16 05:35:08 UTC
From: kipper@ccwf.cc.utexas.edu
Message-ID: <41482@ut-emx.uucp>
Source record: 5549

I don't quite understand why a ham rig modified to run CB should be illegal. Shouldn't the only requirement be that the emissions from the radio meet all of the legal requirements for CB emissions? Forgive my ignorance, but that seems sensible to me as an engineer. Any other requirements would seem to be artificial. Like Mr. Spock said, "A difference which MAKES no difference IS no difference." If a ham rig puts out perfect CB emissions, then while it is doing so it IS a CB rig. What's the deal?

Also, is it legal to modify a CB to operate on 10 meter ham? As a new tech (of the coded variety), that seems to me to be the quickest and dirtiest cheap way onto 10 meter SSB. If I have an SSB CB that runs off of a phase lock loop, shouldn't I just have to change the frequency synthesizer reference crystal to move the whole channel set up into 10m ham?

Thanks,
Kip

jmaynard@thesis1.hsch.utexas.edu (Jay Maynard) writes:

>Tell you what. Come up with a name that describes the intended traffic as well
>as .legal, and is more inclusive than .rules, .regs, or .regulations, and I'll
>adopt it. Fair enough?

What is the intended traffic?

I think we clearly want all discussion of FCC rules in there.

But what about:
1. Proposed rules and petitions to the FCC?
2. NPRM's issued by the FCC?
3. Local antenna/tower issues, laws, covenants.
4. Scanner laws and related issues?
5. Bandplans and other operating agreements?
6. Repeater coordination?

The name .regs or .regulations seems to be way too narrow. Also .fcc would
be equally too narrow.

The name .legal seems to exclude 5 and 6.

The name .rules seems to but somewhat vague but does seem to be broader.

If we can converge on just WHAT we want in the subgroup then maybe the
NAME of the subgroup will come out of that.

In article <4458@lib.tmc.edu> jmaynard@thesis1.hsch.utexas.edu (Jay Maynard) writes:
>Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
>or is it for the average ham?

You have to consider the context of the SAREX packet radio experiment. It was originally scheduled to fly in March 1986. At that time, packet was still a relatively new mode, and the packet "robot" was conceived as a way of popularizing it to the amateur "masses". Of course, as everyone knows, the Challenger disaster in January 1986 resulted in an almost 5-year delay.

I'm sure that if the SAREX robot had flown in March 1986, there would have been many complaints about all that operating time devoted to such an "esoteric" mode. But packet radio is hardly a novel mode any more; if anything, it has been vastly oversold in its present state (1200 bps). Does it really need additional priming?

I admit to being much less enthusiastic about DXing (and DXpeditions) than the average ham. To me it has always seemed little more than stamp collecting with a hi-tech gimmick. But I think it's still fair to ask these questions: when it's all over, what have you gained? What have you learned or created? Have you increased amateur radio's standing in the world?

I'm not saying that the experiment as flown was worthless; to be sure it was fun, it did generate some publicity, and it probably introduced some hams to the mechanics of satellite orbits for the first time. But I can't help but think that much more could have been accomplished.

The opportunity to fly a payload in space, even for a short time on a manned mission, is rare and precious. We should make the most of them, not automatically cater to the least common denominator. Several categories of payloads spring to mind:

1. Technology experiments: more efficient and/or higher speed modems; forward error correcting codes; internetworking tests, etc. The idea is that even though only a few can participate directly, the flight helps advance the technology so it can be brought into the hands of the masses more quickly.

2. Technology demonstrations. Closely related to #1, but using technology that is more mature but not yet widely deployed among the amateur population. The idea here is to create an incentive for the average amateur to learn about the technology and possibly get involved. Some fraction would then get "hooked" and continue to use the technology in other ways (e.g., terrestrially or with unmanned

satellites).

3. Operations with high public relations value. My main regret about STS-35 is that they had to cancel the QSO with MIR. To me, this was much more important than the packet robot, even though it was about as low-tech as an "experiment" could be. There was strong media interest in this part of SAREX; just about every AP story I read mentioned it. But the packet robot rated little more than a footnote, if it was mentioned at all. Amateur radio could have gotten a much bigger boost out of STS-35 had the MIR QSO been pulled off.

Speaking of media coverage, has anybody noticed how the TV media handles those "color" stories on Desert Shield and MARS? The typical story shows some guy tuning an SSB radio, with an almost unintelligible voice coming out of it. The reporter almost always refers to the poor audio quality; I believe I even heard one use the phrase "low tech" to describe amateur radio.

What hurts is knowing that this is true. Face it, SSB voice across the ocean used to be a nifty gee-whiz thing, but now that the public is used to satellites and fiber, we hams and our technology have been left behind in the dust. The same thing happens when I try to demonstrate 1200 bps packet radio to somebody who uses 9600 bps V.32 modems every day.

We can do better, but if we always have to cater to the least common denominator we'll never get anywhere.

Phil

Source record: 5553

karn@envy.bellcore.com (Phil Karn) copies from Compuserv:

>NO-CODE TECHNICIAN CLASS AMATEUR RADIO LICENSE Q&A (Based on FCC info)

I really hate there Q & A things. They make up the questions to fit the answers they want to give you. Let's consider some REAL questions.

>Q: How does the "new" Technician obtain HF privileges (below 30 MHz)? A: By
>passing a 5 WPM Morse code test. The Volunteer Examiner (VE) will award a
>Certificate of Successful Completion of Examination (CSCE) and will notify the
>FCC that the Technician has completed the Morse test. This CSCE will be valid
>for life. No new license or callsign will be issued.

What about the Novice who upgrades to Tech? What will he have to prove to all those who question him about his operations on HF?

>Q: Will the "HF" Technician have to identify in any special way? A: No. The
>FCC decided not to require a suffix or any other special ID for Technicians,
>whether or not they have passed 5 WPM. The regular callsign system will
>continue in effect. The only indicator that one has HF privileges will be the
>CSCE and the name on file at the VE Coordinator and FCC.

What if the dog eats the CSCE, will the FCC issue a replacement one after that particular VEC has departed from the program?

>Q: Why did the FCC do this? A: "The Amateur Service is not growing to the
>extent it probably should, based on what it has to offer. One of the reasons
>we think that providing a non-code entry will be helpful is that it will get
>people, particularly young people who have a primary interest in digital
>communications and computers, interested in this service." - Private Radio
>Bureau chief Ralph Haller, N4RH

Why did the FCC claim to be taking away 220-222 MHz for development of narrowband technologies to correct a shortage of spectrum in the land mobile service when in fact the FCC is now establishing services and licensees in this spectrum to use conventional wider modes?

rc@CMR.NCSL.NIST.GOV (Robert Carpenter) writes:

>Dube Todd asks how we will be able to tell the "with-code" Technicians from
>the "without-code" Technicians, given that there is no difference in the
>calls.

>My answer: The same way you can tell that KA3XXX has an Extra license -
>you can't.

You can ask to see the license. The keyword is "ask". But you might get
responses like:

1. My dog ate the CSCE and they don't issue replacements for those.
2. I had the Tech since 1990, but had to get this new one because:
2a. I moved.
2b. I traded in my KA call for an N call.
2c. It replaced the one my dog ate.
3. I was a Novice and upgraded to Tech and:
3a. I didn't think the Novice ticket was important and threw it out.
3b. The dog ate the Novice ticket and there is no way to replace it.

As you can tell, it is going to be a bit complicated.

>Maybe the FCC database will carry the w/code notation, but I rather doubt it.
>If the code status is in yet another database, it doesn't seem too likely
>that even the Callbook will merge the two.

They do have this empty slot labeled "C" in the existing database dictionary.

>I, for one, think that our present alphabetical zoo of call letters is mainly
>the result of a failed effort at "administrative neatness" involving an
>exquisitely graduated series of license grades, each with its own block of
>call letters. It all failed when hams were allowed to keep the same call
>when they upgraded. How many of you would like to go back to the old system
>where upgrading REQUIRED a new call?

No way!

I'd MUCH RATHER go to a system where everyone gets a basic 2x3 call sign
no matter what class they have, and can BUY ($$$) a "vanity" call including
those no longer in use, silent keys (grace period for relatives to pick up
the call first should be in there). Also special event stations should be
allowed access to the 1x1 calls (yes, they are "allocated" to the amateur
service; see FCC rules part 2).

Notice also that the N4xxx and N6xxx blocks are getting VERY close to being
used up and they will be stuck with K[C-Z]4xxx and K[C-Z]6xxx calls.

Clearly the FCC doesn't care very much about taxi drivers using the
10 meter band, so why should you?

Clearly the FCC doesn't care very much if the land mobile service wants
the amateur spectrum for their own, so why should you?

>PS: When is dube gonna go pound on whoever maintains his site's news

Steve,

I've heard of Cactus, Condor and Walla, although living on the east coast I've not used them. In my own area I regularly monitor a linked UHF system centered in Philadelphia that covers NYC, NJ and eastern PA.

It is easily the busiest system that I scan (busier even than most 2m machines), and therein lies the problem. If you simply link a bunch of repeaters over a wide area, then you've essentially just built yourself a single very wide area repeater with all the associated problems. Unless you're targeting only certain specific areas, you're using spectrum no more efficiently than the single super-repeater.

I think the key lies in backbone linking systems that can multiplex, switch and conference multiple simultaneous channels so that individual repeaters can be selectively linked on user demand without involving repeaters without users involved in the conversation. Other repeaters in the network might be joined in separate conferences so the network as a whole could support multiple simultaneous QSOs.

I don't know if the Cactus/Condor/Walla systems provide this feature, but it seems highly desirable to me. Digital transmission is even more attractive in this situation since multiplexing and switching is now far easier to do digitally than in analog. Indeed, the economies of scale of digital transmission are such that each user's share of the cost of a digital backbone should be small enough to attract support from many more hams than are using the existing systems. Wide area linked repeaters should then no longer be a scarce resource limited to a private elite, but a mainstream part of amateur radio. And of course the backbone would be available to send large amounts of packet data too...

Phil

Subject: Update on Phased Vertical Arrays (long)
To: info-hams@ucsd.edu

In response to the request for help in explaining some problems I was having in building a phased vertical array for 40 meters, I have received quite a large
knowledgable

there are who obviously follow this group and will respond via email but have the good sense to stay out of some of the unresolvable debates. At any rate, the response I got was so great that I can see there's widespread interest in this topic. Hence this note is offered as something of an update on the topic and a consolidation of some of the suggestions I received.

First of all, I followed some of the initial advice I received and went back and
Each
was tuned in isolation of the other on a single 50 ohm cable. Next, I built a new phasing harness consisting of one 0.25 wavelength section and one 0.5 wavelength section of RG/11: 75 ohm stuff. I know that using multiple quarter-wave sections of 75 ohm cable will transform a 50 ohm load to a 100 ohm load. The two 100 ohm loads in parallel at the "T" connector then present 50 ohms to the feedline back to the transmitter. Without a good antenna noise bridge I'll never know for sure, but at least this brought the SWR down to around 1.25. Furthermore, it dipped in the vicinity of my design frequency (7025), so I treated this as absolutely good enough.

During actual use, it did show considerable gain in the general direction I wanted, but with some new anomalies. I have a second antenna I can use on 40 (a double Zepp cut for 160 and up) that provided a good reference point, since the broad side of the Zepp is in the target direction of the phased vertical array. The thing was absolute dynamite in the target direction--at least a full S unit, maybe more. What was curious was that the maximum gain seemed to be off counterclockwise (looking down) from the axis along the two verticals. It turned out to be a rotten idea for a contest: it put out a great signal to Japan (304 degrees from here), but was really poor toward Europe(at 25 degrees). Never again will I try to use a directional antenna I can't
turn in a worldwide contest.

In the comments I received back, opinion seemed evenly divided between people (who seemed to me to be knowledgable sources) about whether the harness should be built from 50 ohm or 75 ohm cable. I used 75 and it worked, but there sure were a lot of people who said to use 50. (I once built a 2 meter array using 50 ohm cable, and it did fine.) Next, the point was made to me repeatedly about
opinion was
that the system needs to be tuned with an RF ammeter at the base of each to insure that each gets an equal current flow when connected in the phased array. Also suggested was using an antenna noise bridge at the base of each to get the feedpoint impedences the same when connected in the array. Tuning is accomplished by adjusting the lengths of the delay lines (notice how easy it is to say that, as opposed to actually doing it?) Several people made the point that simply cutting the delay lines to the theoretical lengths will not result in a 90 degree phase shift. DL6RAI wrote to say that he had actually measured it at 70 degrees in one he had built this way. That computes with my experience of having the direction of maximum gain offset from what I expected. However, I'm

I agree that CB is still useful and can be fun.

In article <1990Nov27.001114.3755@smcnet.smc.edu>, rblack@smcnet.smc.edu
(Russ Black, Media Center) writes:

> One of the leaders of this trip had a CB to use in case of an emergency
>and the fact that he is not a ham operator. On this trip, I took my 2
>meter rig and my CB rig. I tried to raise people on 2 meters but got no
>one.
>

My biggest beef with 2m is that we end up with no one repeater, in the
San Jose area, having any real concentration of traffic-support
communication. Notable exceptions are machines on moutain passes that are
traversed by a highway. Perhaps there will be more traffic support on
2meters when the weather gets worse and there are more traffic problems to
report.

Does anyone monitor 146.52 when they are driving? This would seem to be a
good way to maintain communication with nearby travlers.

I find 2m most useful for calling for help. The higher range of 2m is a
big plus here. The downside is that you must find someone monitoring to
get help in areas away from home where you are not a member of the repeater.

SUGGESTUION:
SHOULDN'T WE MAKE THE '911 AUTOPATCH' ACCESS METHOD COMMON FOR MOST
OPEN REPEATERS?

Reports of not being able to get anyone via any of a number of 2m repeaters
is a bit scary. What happens now if one breaks down in the middle of the
might away from home?

> I never really thought that I would ever use my old (CB) rig again.

I expected my 2 meter rig to obsolete my CB radio for travelling but I
find both types useful. I find CB is more useful for getting details on
unexpected backups and smokie reports. This is true for roads that have
lots of truckers. CB is also fine for car-to-car (over a short range).
My biggest beef with CB is the skip in the daytime wipes out local
communication.

4198. Help with broken RS Pro-2005

Newsgroup: rec.ham-radio
Date: 1990-12-16 10:19:46 UTC
From: scotto@ipars.UUCP
Message-ID: <19@ipars.UUCP>
Source record: 5558
Cross-posted to: rec.radio.shortwave,rec.ham-radio

My RS Pro-2005 scanner croaked a few weeks ago and it doesn't look like Santa is going to bring me a new 2006. I have made several modifications to mine including a COS LED, COS Relay, Quick-Call II decode, improved audio, prototype S-meter, (read: I'm embarrased at the circuit) faster scan, and removed the AC transformer. The scanner worked fine for nearly a year after these modifications.

The symptoms are that it won't receive in any band. The microprocessor seems to work fine. The radio scans, I have complete control from the keyboard, and opening the squelch stops the scan. It appears the PLL is the problem.

When this happened, my cat (actually my wife's cat!) knocked the scanner off of my desk. It fell to a carpeted floor and was picked up immediately. It was still working when it was picked up. When I was told, I looked at the display and it was fine. I heard good audio on hi-band and uhf. Later, (about 2 hours) I noticed the display showing partial seqments and appeared locked-up. I turned the scanner off, checked the power connection (13.8) and turned it back on. It was again scanning merrily along and all was assumed well. When I realized that I hadn't heard any traffic in a while I again checked the scanner. It was *hot* and not hearing anything -- even a 6-watt radio at about 2 feet. I opened the scanner to look for a problem. I can narrow it down to the PLL board being extreemly hot, but not just in one place -- the whole board was hot.

No obvious signs of burnt componets. The service manual says it could be one or all of the custom chips on the PLL board. I'm not competent enough to try and find the problem, much less the cause, without guidance.

I am looking for known problems, ideas on what could have happened, or, lastly, where I can get it repaired. I doubt RS will look at it with all the mods.

Thanks in advance.

>course, as everyone knows, the Challenger disaster in January 1986
>resulted in an almost 5-year delay.

Maybe it was relatively new to the folks in your area in March 1986; here, it was flourishing to the point that there was already significant band crowding. Packet didn't need popularizing, then or now.

>I'm sure that if the SAREX robot had flown in March 1986, there would
>have been many complaints about all that operating time devoted to
>such an "esoteric" mode. But packet radio is hardly a novel mode any
>more; if anything, it has been vastly oversold in its present state
>(1200 bps). Does it really need additional priming?

No...but then, that's only significant if that's the entire purpose of the experiment.

>The opportunity to fly a payload in space, even for a short time on a
>manned mission, is rare and precious. We should make the most of them,
>not automatically cater to the least common denominator.

...in other words, space is for the elite, not J. Random Ham, unless he wants to spend limitless bucks on keeping up on the leading edge of technology.

>1. Technology experiments: more efficient and/or higher speed modems;
>forward error correcting codes; internetworking tests, etc. The idea
>is that even though only a few can participate directly, the flight
>helps advance the technology so it can be brought into the hands of
>the masses more quickly.

Why is this necessarily a good thing to do on a space mission? What does space provide that terrestrial experiments don't?

>2. Technology demonstrations. Closely related to #1, but using
>technology that is more mature but not yet widely deployed among the
>amateur population. The idea here is to create an incentive for the
>average amateur to learn about the technology and possibly get
>involved. Some fraction would then get "hooked" and continue to use
>the technology in other ways (e.g., terrestrially or with unmanned
>satellites).

You're again assuming large quantities of uncommitted funds. The average ham will see that he needs to spend several hundred bucks to make use of the technology, blow off the whole thing, and complain.

>3. Operations with high public relations value. My main regret about
>STS-35 is that they had to cancel the QSO with MIR. To me, this was

>But the packet robot rated little more than a footnote, if it was
>mentioned at all. Amateur radio could have gotten a much bigger boost
>out of STS-35 had the MIR QSO been pulled off.

I agree with you about this one. That we didn't hook up with MIR counts as a major disappointment, even more so than the fact that I wasn't heard by the robot. :-) What you're forgetting are the reasons that NASA approved SAREX in the first place: education (which we accomplished, though not as well as we'd hoped), and good old-fashioned PR - not for ham radio, but the space program. They got that out of it in spades.

>We can do better, but if we always have to cater to the least common
>denominator we'll never get anywhere.

Yes, we can do better, but we shouldn't exclude the average ham in the process.

>AL N1AL

CW transmitters are certainly about the cheapest and simplest way to send intelligence via radio. However, to do real *weak* signal work, the receiver needs to be more sophisticated than most voice receivers. The requirement for narrow filters with minimum ringing drives the price up beyond that required for voice reception. A *very* skilled CW operator with a very high grade receiver can do *wonders*. Yet, I have had sucessful AMTOR contacts where I couldn't reliably tell by ear that a signal was present. I could see it on the TU's scope though. I believe that a good AMTOR setup will get through when 90% of CW operators would throw up their hands. And the radio equipment does not need to be any more complex than a modest QSK CW setup. Of course like everything else, there is good AMTOR equipment and bad. In general, I have not been impressed with the do everything boxes. An ST-6 still outperforms the builtin modems on these things. There is room for a lot of improvement in modems and error correcting codes for mechanical systems while the human CW machine is probably as highly developed as it ever will be.

AMTOR equipment has more patience with fading channels and QRN and QRM than most CW operators. And when the channel is even modestly good, AMTOR will have higher thruput than CW. I haven't heard of any AMTOR moonbounce contacts (I believe the path length screws up the timing). But when reception of three dashes is considered a contact, I guess CW is plenty good enough. I really marvel at those rare CW operators who can reliably hear those three dashes down in all that noise. When I tried it, I was convinced that I was hearing CW in the noise when in fact my preamp was blown and there were no real signals there, just ringing filters and ears. So, like John Henry and the steam hammer, there are those rare CW supermen (and women) who *can* rival

the mechanical systems in current use, but most of us are far from being such CW marvels, and for us, the machines win with embarrassing regularity. And with the advent of affordable DSP, the machines are only going to get better.

Well I can't quote a rule, but notice that QST frequently prints FCC news
releases about confiscated "illegal CB" equipment. The contraband is usually
crude "linears" and modified ham equipment. These seizures are not just for
operating, most seem to be truckstop operations offering the equipment for
sale.

Unless you're planning on using 9600 baud PSK (for UO-14, for example)
the stock 736 works fine. I have the 9600 baud mod someplace, and will
email it if needed. The only other thing that gets a bit squirrely is
interfacing a 736 to an AEA PK-232 -- the two just don't like talking
to each other, and there has been a fair amount of finger pointing by
each company claiming the other is to blame. I've gotten the combo to
work for me by installing some bypassing at the PK-232 end and a 10K resistor
in series with the transmit audio out of the 736's back panel.

That's a hoot. I have seen exactly the opposite opinion regarding
cross posting to groups not carried. Your software is broken if it
allows you to post to groups that you have no way of reading. That was
from someone with whom I was not involved in a discussion of any sort,
much less on opposite sides. I tend to believe his opinion over someone
who would grasp at straws to denigrate an opponent.

I have since added news.groups. It is sort of a waste, don't you
think? Since every post here shows up in rec.ham-radio (or is supposed
to, according to The Net Gospel), I now have twice the space used for
the rec.ham-radio reorg messages, plus all the other discussions. Too
bad some people can't live outside their precious 'guidelines'.

If you want a good cheap HF radio that covers all the WARC bands, but is not
general coverage, the Icom IC730 is an excellent choice. They are going
for about $400 on the used market, and they are nice and tiny if you want
to ever take it mobile.

OK; So install a siren on the site. Noone will hear it. But when the
intruder picks up the repeater's local mike, you WILL hear that:
"Hello, is there anybody out there? Break 1-9...."
You'll come running, but by that time your repeater will be off the air
and who knows where!

Just hope the intruder isn't a jealous ham.
But in that case, it would be legal to have the burglar alarm.
Maybe he would ID for you!?

Actually, using your ham call on 11 meters is LEGAL! The FCC doesn't
care if or how you ID your CB station. So as long as you are running
a type accepted radio and don't mind folks knowing who you are, go
ahead and sign your ham call on CB.

johnan> and server tasks. We would like to split this apart such that
johnan> clients and servers need not run as the same process.

What you want to do is essentially a network server like Mach, or user implemented domains like 4.2BSD (not yet implemented). Your network server is a (possibly multithreaded) process that takes "messages" from local processes, packs them up, and then accesses the hardware interface to send them over a particular medium (or viceversa of course).

To do it under Unix it is almost essential to have the ability to pass file descriptors in "messages", and to poll()/select() (the latter to simulate multithreading within the server). STREAMS does offer you these abilities, and so does UNIX domain IPC. I'd rather go with STREAMS on System V, even if you have a socket library.

I would go with a clone of the AT&T TLI as the API. When you try to open a connection, you must specify a transport provider; the library would then open a well known named stream to the KA9Q server (instead of linking to a multiplexor in the kernel and pushing modules therein), ask it to create an appropriate connection, associate it a file descriptor, and then return over the well known named stream that file descriptor.

I think this can be easily implemented also under monotasking OSes; transferring the file descriptor/handle from the "server" to the "client" would just involve an assignment...

If you want extra details, read the Accent IPC TechReps from Carnegie Mellon, and the Mach documentation on network servers.

If one is prepared to be clever (hacking the Unix scheduler a bit would help), the cost of two context switches on every transaction can be duly minimized.

>bad some people can't live outside their precious 'guidelines'.

Adding news.groups wastes *nothing*, as does any crosspost. The article is neither transmitted twice nor stored twice on disk. It does allow those who follow the group creation process to weigh *all* of the issues before casting a vote. Further, the guidelines - which you show such disdain for - were designed to minimize the possibility that changes would be made that did not reflect the true wishes of the users and admins of the net. Failure to follow them would doom the reorganization effort, as there are many people who automatically vote against any proposal that violates them...or is this your intent - to torpedo a proposal that you obviously dislike in this backhanded manner?

"CW's an artform, not an absolute standard..."

More succinctly: We are no longer training the Signal Corps for WW I.

There are only 2 reasons to have any ham license requirement:
(1) The skill is essential for someone to safely and effectively exercise the privileges that the license grants; or
(2) though not essential, the skill is needed in order to build up our national reserve of skilled operators.

It's hard to justify code exams > 5 wpm on either of these grounds. Learn code to 5 wpm, and you're ready to get on the air, and if you enjoy CW, you'll have plenty of incentive to increase your speed on the air; the FCC need not supply the incentive. We have no national need for a trained reserve of fast CW ops.

>Is SAREX for the elite of amateur radio, as is digital OSCAR operation,
>or is it for the average ham?

Around Baltimore, it appeared the SAREX roboti was pretty much a
disaster. I tried to get to the highest point around with the best
southern horizon, and wasn't able to copy a single packet (or even hear
any transmission) on the robot tx frequency from WA4SIR. Of course, there
was the occasional silly person who accidently transmitted on the
robot tx freq, but that was another problem. I was probably too north
to work it. (Did anyone north of Baltimore work the robot from a non-
mountainous position?). I think the duplex set up
further negates the ability of 2m packet to work (i.e. you could be
transmitting while the shuttle is).

But on the other hand, I thought it was a good chance to get "Joe and
Mary HT" on to space communication (although probably best for people
south of the Carolinas!). Digital space communication is difficult
for people to get into because of the shear number of boxes they have
to buy. Why doesn't some company build a digital 220/440 dual band
radio with built in PSK modems and a TNC? If integrated and mass produced,
I'm sure this would bring down the cost of digital space communication.
I'd buy one!

-Tom

>that seems sensible to me as an engineer. Any other requirements would
>seem to be artificial. Like Mr. Spock said, "A difference which MAKES no
>difference IS no difference." If a ham rig puts out perfect CB emissions,
>then while it is doing so it IS a CB rig. What's the deal?

This is because amateur radio operators are not licensed to service
CB transmitters. You must have a general radiotelephone license to do this,
as CB requires that operators use type accepted equipment (as does other
land mobile services). Amateur radio equipment is not type accepted, so
it can not be used on CB frequencies.

>Also, is it legal to modify a CB to operate on 10 meter ham? As a new
>tech (of the coded variety), that seems to me to be the quickest and
>dirtiest cheap way onto 10 meter SSB. If I have an SSB CB that runs off
>of a phase lock loop, shouldn't I just have to change the frequency
>synthesizer reference crystal to move the whole channel set up into 10m
>ham?

And there is nothing stopping you from doing this -- amateur radio does
not require the use of type accepted equipment. You will have to do more
than just change the PLL to make this work, however.

There are two Morse code practice programs available via anonymous FTP from sumex.stanford.edu in the files /info-mac/apps/morse-code-*.hqx. They both send practice code for you to copy, similar to the code test (i.e., not real words). They both work on my Mac II (and probably on all Macs).

The Hypercard stacks are available via anonymous FTP from apple.com in the files /pub/ham-radio/*hamtestv*.sit.hqx. The stacks are really good, and will be my method of pre-testing myself on the written (when I get around to it). That directory also includes some Packet Radio applications for the Mac.

Cheers!

A radio used in CB service must be type accepted. Your ham radio (a) has
not been type accepted, and (b) could not be type accepted for CB because
it can transmit on other frequencies.

I would recommend taking a BB gun or pea shooter to the lens putting two holes appropriately spaced, then stringing your ladder line through there. This will solve the problem of how to mount the feedline, and will make a lot of motorists happy. Be sure to put silicone around the holes so as to keep the film from getting wet.

>I would think you would need 2 decoders to do this - is this how the
>731 is designed, that is, it requires one decoder for each band?

Yes you can set up different CTCSS frequencies for each memory or
VFO but only *one* can be active at any time and only one band can
have CTCSS decode active.

>2) In cross-band repeater mode using the radio as a simplex range
>extender, is it possible to require, say, the 440 side to use PL
>decode while leaving the 2m side open?

Yes - this is the only way to work it.

>3) Our 440 repeater transmits a PL tone back only when there is audio being
>received through its input (i.e. it doesn't transmit a PL tone while
>IDing, while giving the hourly time report, etc.). Since this is the
>case, if I'm using a 2m HT crossbanded through the 731A, can I turn the

>repeater's carrier to drop before transmitting on my HT? In other words,
>will it switch bands only after the carrier has dropped, or will it
>switch whenever the squelch is closed, in this case being once the
>repeater has quit transmitting PL?

SRI -don't know this one but I guess it would be OK as carrier without
tone does not cause x-band tx.

>4) Finally, with the PL decoder on (or off), will it pass the PL tone to
>the transmitting band with the PL encoder turned off (i.e. will it
>pass PL tones in repeater mode, or do they have to be regenerated)? This
>question is purely academic and probably has little relevence to anything.

No but you can select a tone to TX

Does anyone know anything about this portable?

A few months ago, I saw a Sony multiband radio / tape recorder in a store window in Asuncion, Paraguay. It was a very compact unit and it gave me the impression that it would be an ideal travelers companion IF it performs as good as it looks. My family and I were in transit through Asuncion and hurrying to get a few things done downtown before heading out to the airport, so I didn't take the time to give the radio more than a passing glance. I didn't even go inside the shop that had it on display or scribble down the model number, which was WM 8000 MK II, to the best of my recollection.

Since then, I have kept my eyes open but have not seen the radio in any stores I have visited nor in any catalogs that I have in my collection. Does anyone know anything about this item? Does it perform? (Any reviews out there? Specs?) Is it a new model? A discontinued model? (Could be either for all I know.) Who distributes it? Is/was it marketed in the U.S.? What is/was the list/going price? Features?

I suspect that the FCC's recent creation of a code-free entry class
license will be the cause of much debate in this newsgroup over the
next few months (years?). In any case, the deed has been done and
it's up to us experienced hams to welcome the new licensees
into our hobby graciously. I was glad to see that the FCC granted all
Tech privileges above 30 Mhz to the new class, thus allowing them to
make use of the popular 2-meter band (in spite of the ARRL request
that they only be allowed to use 220 and above). This
seems to indicate that the FCC wants us to absorb the new licensees
into the mainstream of VHF and UHF ham radio and to avoid treating
them as "second rate" hams. Whether or not we agree with what the
FCC has done, we should not "take it out" on these newcomers to our
hobby.

4225. Curtis "B" Timing (was CMOS Super Keyer II)

Newsgroup: rec.ham-radio
Date: 1990-12-17 13:54:00 UTC
From: MOSIER@UNCG.BITNET
Message-ID: <EAFACB58567FE0466B@uncg.bitnet>
Source record: 5385

WA2SRQ asked about "B" keyer timing, and what a character of the opposite kind was. I was sure someone else would answer, but nobody did, so here goes. "B" timing is just iambic mode. And a "character of the opposite kind" is a dit if you are sending a dah, and a dah if you are sending a dit.

Webster defines an "iamb" - from whence comes "iambic" - as a short syllable followed by one long syllable, or one unstressed syllable followed by one stressed syllable.

You have probably noticed that if you depress (squeeze) both paddles of an iambic keyer, it sends alternate dahs and dits. What you may not have noticed is that when you release the paddles, the keyer completes the character it was on when you released it, and THEN sends the opposite character. Thus, if you depress the dah paddle, immediately thereafter tap the dit paddle, and then immediately let go, you get a K (dah-dit-dah): the first dah because that is what you pressed first; the next dit because you had both paddles pressed (squeezed) - if only for an instant; and the final dah because you released the paddles while the dit was being formed, causing the completion of the dit and then "the opposite character" (the final dah). When sending things like the C or the period, you have to anticipate this by releasing one character early.

4226. A New Problem

Newsgroup: rec.ham-radio
Date: 1990-12-17 14:01:16 UTC
From: kipper@ccwf.cc.utexas.edu
Message-ID: <41520@ut-emx.uucp>
Source record: 5386

Uh oh. Here comes another big bad issue for everyone to kick around. I actually heard most of the participants on BOTH SIDES of the "Herbie" thing agree on something: on 2 meters, no one, and they meant NO ONE, was to talk to those "d#%$ no-code Technicians." I sense a huge war brewing here in which everyone will lose. Will repeater owners bar no-code Techs from using their repeaters? Will things degenerate into a "let's see who can QRM who to death" situation? Instead of the comradery that should be part of ham radio, I see lots of problems coming.

I hope my Tech license arrives before the new rules kick in; I'd just as soon have my Group C call from the start so that all of the old guys know that I'm a "real" Technician.

>difference IS no difference." If a ham rig puts out perfect CB emissions,
>then while it is doing so it IS a CB rig. What's the deal?

From an enforcement point of view, it's easier to police a few manufacturers
than millions of users. The FCC took the easy way out and required type
acceptance for the radios.

>Also, is it legal to modify a CB to operate on 10 meter ham? As a new
>tech (of the coded variety), that seems to me to be the quickest and
>dirtiest cheap way onto 10 meter SSB. If I have an SSB CB that runs off
>of a phase lock loop, shouldn't I just have to change the frequency
>synthesizer reference crystal to move the whole channel set up into 10m
>ham?

Yes indeed it is perfectly legal and practical to convert a CB set to
10 meters. Thousands have been converted. Generally, the synthesizer
crystal is not the one you want to change in a SSB CB. Usually there
is a fixed mixer oscillator that needs to be bumped up a couple Mhz.
Get a SAMS for your set and find out.

Additional footnote. From (i forget) but probably a WWII vintage
Radio Amateurs Handbook (they kept printing em...), there were
articles on LF License Free ops and "wired wireless" (power line
propagated LF.) I have no idea if these were actually used. I seem
to recall that in certain areas (near military bases, ferinstance)
even these were forbidden.

As it happens, I was over in the library last week and came across a
1944 handbook--it looked like it had never been cracked. There was a
chapter about "Common Carrier Communications," i.e., coupling a signal
(usually CW) into the power lines. The frequencies of choice were
between 150 and 200kHz and "propagation" varied from 5 miles in the
city to more than 10 in the country. The power limit was expressed as
the amount of signal detectable from a certain distance from the power
line. The construction example in the handbook was a 25W job. So it
appears that they were definitely used--leave it to us hams!

The advertising section in the back had a lot of war-effort rah-rah,
ususally depicting a pennant with an "E", referred to as the Army/Navy
E. I assume that was a citation for contributing to the war effeort,
right?

Hello, I am looking for information on controlling the ICOM-751A
transceiver via the interface plug on the rear of the unit. Icom
sells the EX-309 interface, but I am unaware of any software for it.
I hate to pay that much $$ for the interface if it is nothing but a
level converter. If anyoune has any info on the Ex-309 or software
control of the 751A, please E-mail or post. If there is any interest,
I will sumarize to the net.

It is nothing but a level converter. Make your own for a lot cheaper.
Also, the software is not very difficult. There has been stuff posted
and other software is available. I have distributed a simple hack I
wrote for the PC that loads memories from a file.

FOR SALE:

If anyone would like a cheap CIV interface complete with LEDs to blink
and look cool I have about a dozen RS-232 "repeaters". These are a
tiny black box with LEDs and two connectors (One DTE and one DCE) and
a small wall-tumor power supply.

I will sell these and the wiring diagram (2 cuts and one add plus the
mini-phone to the radio) for $15 each, including postage. Enclose a
disk and I can pass on any source code for CIV control that I have.

My address is 107 Oak Ridge Drive, Ayer MA, 01432.

Also because of nasty ITU regulations.

More reasonably, code is exceedingly useful in low-power operations.
Yes, DSP is going to change everyones life who can afford it, but
morse code still serves a serious need for efficient communication
with exceedingly small bandwidths (important on shrinking ham bands).
If you have ever tried to work a satellite on battery power (like I did
last field day), you'd see that morse is about the only reasonable way
of pulling it off.

Of course, I really haven't used code since then...

>code are perfectly free to continue using it. (this even includes me from
>time to time) Your overreaction to Henry's gentle ribbing reminds me of
>Shakespear's line "methinks thou dost protest too much."

-excuse me????

I'm not comming down hard on henry because of his preference for phone over
cw. I'm comming down on him for the rude, irrational, inconsiderate, answer
he gave Shailendra. Shailendra asked a question,"Say, why do people use
morse nowadays anyway?" I assume this to be the genuine curiosity of a new
ham. If this is the case receiving the answer Henry posted would be not
the least bit helpful.
(henrys response)
--For conformance with antiquated regualations, because they're old-fashioned.
--or because they're stranded on a desert island which is well-supplied with
--analog electronic parts but has no digital parts. Morse is basically
--obsolete, since digital modulation techniques are far superior at punching
--clean signals through noise.
This is not how a ham elmers another ham. This is mixing politics and "religion"
with lending a helping hand. Personal beliefs are no reason to waiver courtesy.

The no-code battle is not over. There are those who want to eliminate the
present "novice, tech, general, adv, extra" class structure. While i believe,
and have always stated that the phone bands should be open to all hams who
want to use phone I dont want to see the cw bands eliminated or restructured.
Further i stated that this is not to have 'exclusive' bandspace but to simply
have a place where i can run high speed cw. I am not a high speed wizzard
but can keep up pretty well. I would like to get better, the only way to
do that is by working others with similar goals. they are found in the "low"
end of the band.

Again I would never take an anti-phone position, yet pro-phone people are
very comfortable taking an anti-cw position. This breaks up the ham radio
community into two groups. If we are already divided it will be easy for

anyone to break us up further. I am promoting "fraternity and sorority"
these are good things. I don't think your comment "lighten up" is appropriate.
Nor is your Shakespearian referance, the context is wrong.

>To paraphrase my reply comments on 90-55, how come you guys only mention
>the simplicity of the cw *transmitter*? It seems to me that a workable cw
>*receiver* is quite a bit more complex than the simplest AM receiver, the
>crystal set.

My dear phil lend me your ear and i will enlighten you. You can recieve
CW with a crystal set (shhhh don't tell anyone it's my secret and yes I have
done it).

>>"Morse is basically obsolete, since digital modulation techniques are far
>>superior at punching clean signals through noise: Sorry, here you are simply
>>wrong. I suppose you could argue speed but not punching through. I have

>>a nand gate for the final (i think it was something like .1mW output). No
>>insult intended.

>This argument is also answered in detail in my reply filing, and Bill, *you*
>are simply wrong. Rather than repeat the entire thing here, I refer you
>to it. Suffice to say that CW, as it is generally used in amateur radio
>(on-off keying of a carrier) is *extraordinarily* inefficient in terms of
>both bandwidth and power. Many more computer-oriented digital transmission
>techniques exist that are far more efficient than manual CW, and some of
>them are even in use by amateurs. (this is not to say that these techniques
>don't also have a lot of room for improvement - they do.)

YIPE YIKES first off only my grandmother calls me bill. You can see I sign
my name Buzz (FYI :-))

Phil, I don't claim to know everything (although some people think I do :-))
If you can show me a digital mode that operates at roughly the same speed
as 20wpm cw and uses less than 200hz (not Mhz or Khz but just hz) of bandwidth
(this is the bandwidth of a cw signal) and can work all states on .1mW (1/10000
watt) then i will believe you. I'm not a religious nut over cw if you have
information please let me know. I don't have your previous posting possibly
you could send it to me. Oh yea digital is cool but really cool digital
stuff costs $$$$$$$$$$!!

In closing Phil I hope you realize that I'm bananas or fanatical about code.
-i support full phone privs for everyone
-i like the no-code licence (i don't like HOW they did it)
-i believe cw is fun, cheap, efficient and effective

if you can show me otherwise great! I will have learned something and possibly
expand my hobby. otherwise . . . in the words of Calvin Hobbs after seeing
all sides "your still wrong!"

Well folks we have a new class of Hams comming on board. The FCC has changed the rules and if you agree or not here they come. Now it is up to us!

It is our job to find the people that will help the hobby grow in a way that we can live with. Here is the people that we need to find to help the hobby!
- Technical gurus that will add new technology to the hobby.
- Get Kids involved so they can experiment with radio and computers (kids already love the computer and love the Radio Shack walkie-talkies!)
- How about a friend or maybe your wife who are interested in public service?
- Are there others? Let us find them!

I told my wife about the new license and she is ready to go! I am sure she will be ready to take the test in February. I have already told her I will buy a new COMPACT HT for her to carry in her purse! She is going to be ready for the next Earthquake!

I told some friends at the company Christmas party about the new license and they all said that they were ready! These were all very tallented engineers that will contribute in networks and digiatal control!

It is all up to us! So go out there and get the new hams ready!

It is important to remember that all of these new people will be getting involved at the same time. We will need to make sure they ALL learn good habits and not the bad ones. Take the time to help the new ham to be sure that they have everything they need to have fun and to be part of the entire HAM population!

I expect that I will have study meeting to help study for the new exams at my company! Are you ready for the 90's!

Actually, the rules for working on CB were relaxed a while back.

BUT, CB's MUST be type accepted, and type acceptance REQUIRES that the CB have 40 discrete channels, and no more, and that these channels are NUMERICAL, not frequecy oriented. In pre-40 channel days, where there were licenses for some special allocations that are no channels 24 and 25, they could only LEGALLY be installed in a CB if a CB channel was removed on a one-one basis.

COnverting a CB to HAM is 100% legal, if you do it right, but that also means the unit is NOT to be put back into CB service. I have a unit that goes 100 channels wide, and was used for the first block in a 2m SSB transverter setup. The radio is 100% legal as HAM, but only as HAM equipment. If I ever disconnect the transverter and transmit on CB, even without going 'out-of-band' the radio is illegal, at least as far as I read the law.

>This is easily modified, and the result works well keeping a 50ma.
>charging current to the battery.

This is probably not all that good an idea if you use the rig a lot on external DC. A simple charging system like this has no provision for ending the charge if the battery starts to overcharge, and it's voltage depression due to over-charging that really causes the NiCd problem that most think is "memory." (NiCd cells really don't have a true "memory" problem, at least not one which will normally be seen in the vast majority of applications. Details and references available on request.)

Tried mailing and it bounced... Unless your TS520S has the DC power module, a 12V power cord won't do you much good. (Actually, I'd like to get a schematic of the power module, which I gather is mainly a couple of power transistors that switch current in the built-in power transformer...) And you can use 'most any 50k ohm mic; for a while I was using a Radio Shack electret mic that took a AAA cell for power. Radio Shack also sells (or at least used to) 4-pin mic connectors that work in the TS-520S.

Re Why CW??

After perusing a brief article in QST about how few hams there are in India (VU2xxx) ......

All the talk about how "cheap" and "available" digital techniques may be true in some parts of the world but it certainly isn't true worldwide. It sort of reminds me of how coworkers disparage 68000-based workstations as being antiques while some countries are still putting import restrictions on hand-helds......

Feel free to use digital, but don't forget it's a great big world out there. Perhaps one should have more respect for the poor third world ham who uses a sawblade hand key and string-and-gum-wrapper transmitter to give you a DXCC card. Then again, maybe there aren't many of those either......

Actually, there will be three Technician classes.
1. Took the General written exam and 5 WPM (the oldest)
2. Took the current Technician written exam and 5WPM (past couple years)
3. Takes the new Technician written exam and no CW (starting in about 60 days)

> I also understand that there will be no
> call-sign differentiation. So how will we bge able to tell if a Tech who
> is operating below 30 MHz is authorized to do so?

Don't worry, I am sure there are lots of op's out there are already warming
up their rigs to "police" things. Maybe 14.313 is just the beginning.

I downloaded this late last week and whipped up the little comparator
circuit, not expecting much. Wow! What an amazing program!
One of the first things I copied was the W1AW bulletin announcing the
no-code license. Then spent the rest of the weekend poking around on
20 meters "printing" DX (JA, PY, VE8, VK, etc).
I haven't messed with RTTY since my college days of
a PLL decoder and an old model 19. This certainly compares favorably
with that experience. The spectrum display is amazing too... How is
it done? Certainly my PC can't do an FFT with that many spectral lines, that
quickly...

Many thanks for the most valuable and interesting piece of freeware
I've seen in a long time...

---

Morse IS a digital modulation technique! While it's far from the best, it's one of the easiest and cheapest to implement. It's good enough that in weak signal conditions it beats the current voice systems.

We do what we do because it's: a) fun to us. and b) sometimes useful.

Let me rephase your last sentence:

Amateur Radio is basically obsolete, since telephone company techniques are far superior at punching clean signals through noise.

Bill - WA7NWP "20 meters would be a great digital-only band."

Conformance with regs has nothing to do with it. Nobody will force you
to go anywhere near a key after you get your license. Besides, some of
us *like* CW.

You know, if I changed the above question to:

Say, why do people use 16 bit architectures nowadays anyway?

your answer would still apply. Come on, Henry - you've only had a
"no code" computer for a year or so :-)

It is incumbent on all of us to welcome the new no-code Technicians into the mainstream of ham radio.

The FCC gave them 2-meter privileges (after having proposed not to do so) precisely because of this -- they want the new Techs to be REAL hams, not exiled into some UHF ghetto.

If the present hams ostracize the new Techs, the present hams will look very bad in the eyes of the FCC. Remember, the FCC doesn't give us spectrum to preserve the radio traditions of 1920. They give us spectrum in order to serve the public, enhance international goodwill, advance the radio art...

So here's my message to all the new Techs: WELCOME!

>words). They both work on my Mac II (and probably on all Macs).

I don't know which programs are on sumex, but if they're the same two
as are on apple.com, they *do* accept "real words". You can create an
ASCII text file and have the code program play it for you. This allows
you to drill yourself on certain words (such as "antenna", "QTH", or
whatever.) Or if you like, you can have someone else write the file
so you don't know what's in it.

The two we have are Morse Trainer from N6MZV and Morse Tutor from WA4FIB.
They're in the directory pub/ham-radio.

Actually, if it is possible for anyone to gather the statistics from the various VEC's, I think a lot of people would be interested in seeing those statistics published every month for the next couple months. Just to see if this new class really has any effect on the number of people going for their ham license. I know of 2 people right of the bat that have started looking for a test site since hearing that the CW is not necessary any more. Both are interested in packet and not talking on the local repeater. And for the sake of those collecting demographics, one is male and one is female. :-)

> >cross posting to groups not carried. Your software is broken if it

> Oh, I'm sorry. I expected that, since your site is on Usenet, that it would
> carry the groups that discuss Usenet itself - news.*. How foolish of me.

The topic was not whether carrying news.groups is good. It was about
the ability to post to groups that may not exist. You make the claim
that my software is broken because it will not let me post to a group it
thinks is non-existant (and if it is not in the active file, it isn't).
I would claim that any posting software that does not stop you from
posting to a group that might not exist, and you certainly couldn't read
responses from, is broken.

Argue the topic and not some sarcastic clap-trap.

> Please feel free to continue in your ignorance - after all, ignorance is
> bliss, and you certainly appear to want to avoid being unhappy.

And you miss the very next line that says I have since added
news.groups. In fact, it is the major point of the next paragraph. Did
you 'ignore' that? Are you blissful? Do you feel better fighting an
ad-hominum war -- that is what you seem to want. You started it.

> > I have since added news.groups. It is sort of a waste, don't you
> >think? Since every post here shows up in rec.ham-radio (or is supposed
>
> Adding news.groups wastes *nothing*, as does any crosspost.

Any article appearing in news.groups that is not cross posted uses
disk space, on ANY system. Any article appearing in news.groups that is
cross posted to comp.sys.amiga or rec.nude DOES waste both space and
bandwidth on THIS system, as neither of these groups is carried here.

> The article is neither transmitted twice nor stored twice on disk.

At your site, cross posts are not stored twice on disk. At my site they
are. You are making a blanket claim about all sites when I am making specific
claims about this one. Unless you know all sites, and can convince me that my
site does not behave the way I know it does, you are just plain WRONG. Take
a moment and consider that not all sites are the same, and, just maybe, I am

correct in saying that discussions re:rec.ham-radio take up twice the space on this system now that I have added news.groups. Would that kill you?

> ...or is this your intent - to torpedo a proposal that you
> obviously dislike in this backhanded manner?

In the same manner you try to torpedo my objections by making false claims about my system when you know nothing anything about it?

If you want to continue the ad-hominum battle you started, take it to mail.

In <vodall@hpfcso.HP.COM (Bill Vodall)> Bill asks:

(Re: Re: 10 meter rig recommendation?)

>Is it illegal to modify a rig to RECEIVE CB?
>
>Is it really illegal to modify a rig to make it capable of transmitting on the
>CB band? There's no question that it's against the rules to transmit with
>it. Is the mere ownership of a non-type accepted CB rig illegal?

Was this tongue-in-cheek? How many more times will these same questions appear
on the net?

It is not illegal to MODIFY equipment.

It is not illegal to BUILD equipment.

It is not illegal to OWN a receiver.

It is not illegal to OWN a transmitter.

It is not illegal to TEAR UP equipment (presuming it's yours).

a license to do so; or to use transmitting equipment that has not been approved
for the particular service.

It doesn't take a lawyer to figure this out; all it takes is the ability to read
and apply common sense.

In rec.ham-radio, karn@envy..bellcore.com (Phil R. Karn) writes:

>DSP filters can operate over a much wider range of bandwidths than the
>human ear/brain can. In particular, DSP filters can easily achieve bandwidths
>much smaller than the 50 Hz figure that is typical of a trained CW operator.
>This makes it possible for a DSP-based system to demodulate signals that
>aren't even detectible by ear. Examples include N4HY's demodulation of
>4 bps signals from the Soviet "Vega" balloon probe in the atmosphere of
>Venus, and the N4HY/W3IWI DSP moonbounce experiment.

People have been doing moonbounce on CW for years. My impression is that
it takes pretty sophisticated (expensive) hardware to approach what a
good CW operator can do. Note here I'm talking about speeds near the
human optimum (10-30 wpm or so).

>No, there's nothing magic in DSP. Nor is there anything magic about the
>brain/ear combination when it comes to operating as a modem.

Throw in interference in addition to noise, and I bet the human ear can
beat anything anyone short of the NSA can build for a halfways-reasonable
cost. Those who have never gone beyond barely learning enough CW to pass
the 5 wpm test have a misconception of what a "good" operator can do. I
have had the experience of visitors to my shack being utterly astounded
that I could easily copy a signal that they considered to be completely
inaudible due to noise and interference.

>>For sending human-readable text at
>>slow conversational (rag-chew) speeds over narrow bandwidth channels,
>>CW is unmatched. It also has the advantage of simple, inexpensive
>>equipment.

>If by "human-readable text" you mean something that can be decoded
>directly by the human ear/brain without any extra equipment, well, even
>the best CW ops I know still require a receiver and antenna. :-)

By "human-readable", I just meant English-language straight text.
(As opposed to code groups or computer codes.)

>As for CW being the only mode that can use simple, inexpensive equipment,
>it depends on how you define those terms. Packet radio TNCs are fairly
>simple and inexpensive by my standards, inasmuch as they are usually
>smaller and cheaper than most receivers. And given the trends in digital
>vs analog electronics, I expect that the cost-effectiveness of digital
>communications equipment will continue to increase very rapidly.

A complete packet station requires 1) 2-meter (etc.) radio, 2) TNC and
3) computer or terminal. For a garden-variety AT, new synthesized radio

and packet-only TNC, we're talking, what $1500-$2000? With a dumb terminal and used radio, it's still in the $300-$500 range. You can get a good-condition Johnson Viking and Heath Mohawk receiver for way (WAY) under $100! :-)

You can also build a nice direct-conversion receiver/transmitter fairly easily. Not too many folks building TNC's and 2M FM rigs from scratch.

Indeed, phone operators do slow down their speech when conditions are
bad. But CW will still get through when voice communications is
impossible.

In a reply to Phil Karn's article commenting on the problems of the protocol choices of the SAREX mission, Jay Maynard replys:

>...in other words, space is for the elite, not J. Random Ham, unless he
>wants to spend limitless bucks on keeping up on the leading edge of
>technology.

The problem with the mission, as I see it, is that this was also not for J. Random Ham, but for the stations with the power and large antennas to break the pileup enough times to complete the entire protocol dance in the limited time.

Given these requirements, a non-connected sequence could have been created that reduced the number of required successes, making it more likely that the random ham would have been able to work the shuttle.

>I agree with you about this one. That we didn't hook up with MIR counts as
>a major disappointment, even more so than the fact that I wasn't heard by
>the robot. :-)

I was also disappointed that the contact with MIR didn't happen.

I was heard by the robot, and got UA frames back, but never a sequence number or disconnect. (I would have believed the publicity that said a number was good enough, and quit trying then.)

As for the related point of the rotten SSB quality to the mideast, I think part of the blame for that goes to current transceivers, which really mangle the audio. I have been told that old phasing transceivers existed that had very nice SSB audio, but I have never been fortunate enough to hear them. It may be unfair to berate the modulation method when we use it so poorly.

I have used an ST-6 for old-fashioned RTTY years ago. The TTY machine
would be down to essentially zero copy with a signal that would still be
nearly 100% copy by ear on CW. Of course, AMTOR has error-correction,
but it still has to have a mostly-correct signal for the error-correction
to work.

The December 1990 issue of QST has a short article on the protocol and hardware to talk to any ICOM radio (that has the interface) with your computer. I think it is in the Hints & Kinks section.

4262. Alinco 590T info

Newsgroup: rec.ham-radio
Date: 1990-12-17 21:22:16 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9012172122.AA24732@lonexc.radc.af.mil>
Source record: 5422

hello I'm back with a still deeper unwinding of Alinco'
s mystry.

A while ago someone asked what does the ADD button do on the rig. I checked
and found that it did nothing . . . hmmmmm

well it has one function that is useless in that it changes the bandscan
function. (when used as intended).

Here is how to make it sing!

The 590 has 2 band limit memory sets 1L & 1U and 2L and 2U.

The ADD function will allow the scanning of one band limit and then the other.
Acording to the instructions the 2L & 2U pair are for 440....not true!

Example.

Enter the lowest 145Mhz repeter frequency into 1L. (see the repeter directory)
Enter the highest 145Mhz repeter frequency into 1U.
Enter the lowest 146Mhz repeter frequency into 2L.
Enter the highest 147Mhz (they run together) repeter frequency in 2U.

press F then ADD (ADD will be indicated on the display)
now initiate band scan.

the rig will now scan as follows
1L frequency ----> 2L frequency ----skip---- 2L frequency ---> 2U frequency
^ |
| |
<-------------<------------<-----------<----------<---------<-----

Now if you couple this with the automatic offset selection that i outlined
earlier you can scan ALL the repeter frequencies with out going through the
simplex/cw/ssb/etc frequencies. A real neat feature when travling out of
state!!!!

Be very careful here. The KA9Q NOS software assumes that each of the tasks are run to completion, and are *NOT* timesliced. When I did the port of the NOS code to the Amiga, I investigated scrapping much of the tasking package used in NOS, and using native Amiga processes (after all, it is a multi tasking operating system on the Amiga). The problem is that there are not synchronization primitives to protect against a NOS task being interrupted before it voluntarily gives up control.

In the end, I continued to use the NOS tasker, and just ran it all as one Amiga process.

4264. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-12-17 21:52:17 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901217145217.238016b5@HG.ULeth.CA>
Source record: 5424

/\/\/\

flare effects hit and have remained at near normal levels since then.

The second major flare occurred from Region 6402 at 20:52 UT on 11 December. This flare was rated a class M6.5 x-ray flare, but only attained a very small SB (brilliant subflare) optical class. This flare was accompanied by only weak discrete radio bursts. The most severe terrestrial impact produced by this flare was a moderate intensity, moderate-duration SID/SWF which affected short wave frequencies up to 13 MHz for about 70 minutes over the sunlit portions of the earth.

The third major flare was rated a class M5.1 x-ray flare. Like the second flare, this third flare was optically weak. At its peak intensity, it was rated only a meager SF (faint subflare) optical class. The flare originated from Region 6398 at 08:03 UT on 12 December. It's only terrestrial effect was a SID/SWF.

The final major flare of the week occurred from Region 6398 on 12 December and was the most significant x-ray flare of the week. This flare attained a class M8.9 x-ray intensity at 14:10 UT, but like the other flares, only attained a weak faint sublare optical intensity. The duration of this flare was a respectable 71 minutes and was associated with a moderate intensity, moderate duration SID/SWF. This was the only significant terrestrial impact observed from this flare.

The cluster of regions which produced this weeks activity quickly rotated out of view between 12 December and 14 December. Their disappearance produced a steep decrease in the solar flux. By 14 December, the solar flux had dropped 32 points from 236 on 12 December to 204 on 14 December. This cluster of sunspot activity will begin to return near 26/27 December. Models currently suggest that the active sunspot forming regions will likely remain intact during their transit on the far side of the sun, but magnetic complexity and flaring is expected to drop before it returns near 26/27 December, barring any new developments of complex active regions in that area. M-class flaring will probably still be possible, but major flaring is not too likely. If the models are correct, a moderate to strong increase in the solar flux should accompany the return of these regions back into view between 26 and 28 December.

Since the disappearance of the active regions beyond the west limb, attention has been focused primarily on Region 6410 and 6412. Region 6410 had exhibited significant growth and increased flaring earlier this week, but has since shown signs of slight decay and decreased flare output. This region will probably begin a more rapid decay within the next 2 to 4 days. Region 6412 (which was old Region 6368 on its last rotation) is the largest system on the solar disk at the present time. It has retained a relatively complex configuration capable of producing M-class flares. A total of 45 spots are encompassed in this region, which covers an area of near 4,230 million square kilometers (1,650 million square miles). Although old Region 6368 was associated with several magnetically complex areas within it's boundary, it has degenerated and presently consists only of a type Beta magnetic configuration.

In all, there were over 17 M-class flares this week, almost all attributed to the active cluster of regions which were in the northwest solar quadrant before rotating out of view this week. Of the regions which were active, Region 6398 was the most active, producing near 50% of the flare activity observed this week. About 40% of the remaining activity was attributed to Region 6399 which showed a dramatic and intensive burst of M-class flaring on 12 December. The remaining 10% was shared by the other less-active regions on the solar disk.

This week was full of SID/SWF's. At least 14 SID/SWF's were suspected this week due to the solar flaring. Short-wave radio experienced frequent periods of degraded signal quality during these SWF periods.

No significant proton enhancements were observed, despite the increased solar activity. However, the background X-ray flux increased notably during the week to levels near class C2.1. It has since declined to levels near B9.1.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low to moderate over the coming week. The most active regions currently on the solar disk are just passing the central meridian as of 16/17 December and will begin rotating out of view near 22 December. Region 6412, which is the most significant easterly region, will rotate out of view around mid-day on 24 December. Although M-class flaring is possible from Region 6412, no significant major flaring or increases in activity are expected, barring the appearance of any new major active centers.

Geomagnetic activity is expected to remain mostly quiet to unsettled this week. Auroral activity will likewise remain quiet and not visible. HF radio propagation conditions are expected to be normal this week, but with an increased risk for SWF's during the local daylight hours. VHF will remain normal this week with no significant opportunities for DX expected. The MUF has decreased by about 10 MHz since the early part of this week, and is expected to decrease further as the week progresses. However, widespread openings on 10 meters should remain possible throughout this week. No significant openings are expected above 50 MHz.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 17 DECEMBER

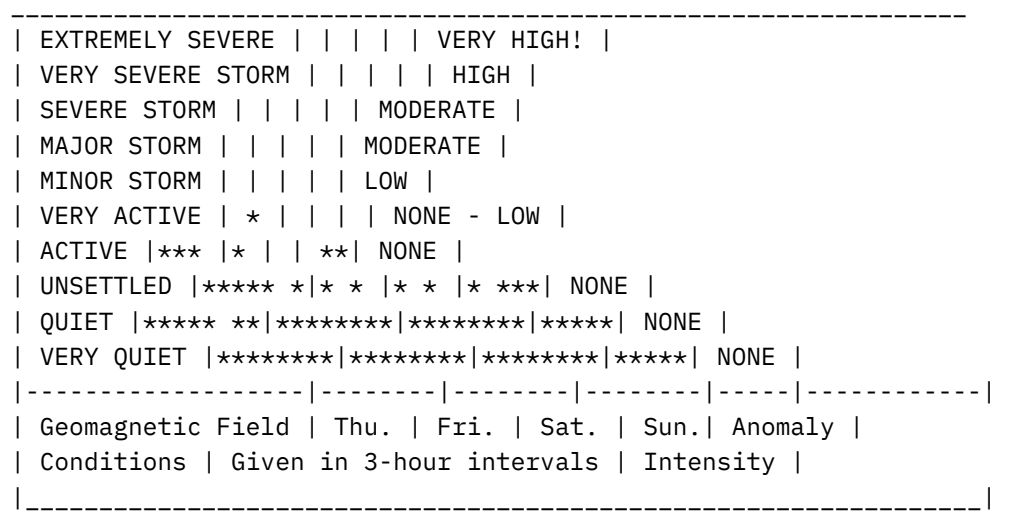
GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours



NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca.

>
>Clearly the FCC doesn't care very much about taxi drivers using the
>10 meter band, so why should you?
>
Right now only CW OP's are blown off by big sigs on 28.005,15,30 and 45 with great regularity. This weekend I was having a nice QSO with a GM in the morning when a horendous LSB station came on 28.015 with a reverb mike that sounded like the voice of GOD commanding HIS children. Then these two CB'ers started arguing about the best way to cook curried chicken. They wasted at least 10Kc of spectrum with their culinary discussion. As usual I moved off and tried to find the GM but he was probably too disgusted to continue.

For the moment this sort of thing is unknown to phone only people but I have begun to hear illegals creeping into the upper and lower portions of other bands as well. It won't be long before there will be no Amateur Radio to be enjoyed by the new no-coders with their hard earned priviledges.

A message to all who want to be able to enjoy the hobby in the future:

FIGHT LIKE HELL TO KEEP THE 30 METER BAND AND DIE IF NECESSARY TO KEEP IT CW ONLY.

A message to the more virulent no-coders out there:

IF WE GIVE YOU ALL OF THE REST OF THE SPECTRUM FOR NOTHING...WILL YOU LEAVE US ALONE ON 30 METERS?

Thank you all in advance for your civility, friendliness and patience.....

Somehow, a line got lost in my message. I've included it in brackets below:

In <vodall@hpfcso.HP.COM (Bill Vodall)> Bill asks:

(Re: Re: 10 meter rig recommendation?)

>Is it illegal to modify a rig to RECEIVE CB?
>
>Is it really illegal to modify a rig to make it capable of transmitting on the
>CB band? There's no question that it's against the rules to transmit with
>it. Is the mere ownership of a non-type accepted CB rig illegal?

Was this tongue-in-cheek? How many more times will these same questions appear
on the net?

It is not illegal to MODIFY equipment.

It is not illegal to BUILD equipment.

It is not illegal to OWN a receiver.

It is not illegal to OWN a transmitter.

It is not illegal to TEAR UP equipment (presuming it's yours).

[It is ILLEGAL to transmit on a frequency or band for which you do not have]
a license to do so; or to use transmitting equipment that has not been approved
for the particular service.

It doesn't take a lawyer to figure this out; all it takes is the ability to read
and apply common sense.

>
> Also, EVERY single weekend, someone would go out with a spray can
> of black paint and opaque out the lens. (not that I would suggest
> such a thing)...

Does anyone remember the days of the "Whammy"? These were the two "tubes" stretched across the road at measured intervals that measured the time required for a car to trip the two wires. Usually there was a cop hidden in the trees just off the road who would take after the speeders. Also, some jurisdictions took to placing plain rubber hoses across the road as decoys. They accomplished the same thing: getting speeders to slow down for a few hundred yards.

In defining police radar, someone stated that it is a locating device. This is not correct. Police radar cannot tell you where the target is; neither can it tell you which direction it is moving. Only the operator can determine that; and the device can only measure speed.

Also, my definition of telemetry doesn't fit, because the device does not transmit the data it derives; it just displays it.

IMHO, it is important that none of these speed detecting devices solve the problem of speeders killing themselves or others a few miles down the road past the speed check points.

Just called the NTIS today (Monday, December 17, 1990 - there,
that better? :-), and they said that the FCC had gotten the
callsign database to them last Friday, they should have it
out to me sometime this week (and, of course, I'm going to
Colorado for a week, so I will not get the data until at
least December 30, sorry about that folks!).

So, all you callsign project folks - sorry for taking so long
to post anything, but at least its "real news" now.

Rusty (aka Mr Callsign Project, aka Rusty "I must be nuts to be
doing this again" Carruth :-).

Here! Here!!

I see this as an opportunity for us to recruit many new people into the Ham Radio Fraternity! I even got the XYL to say she would now study for the Technician license! I have started working on a couple of co-workers.

I think we should put messages out to other news groups which we are personally envolved with that could benefit by the changes. (i.e. back packers, bicyclists, aviators, boating enthusiasts, video users, all the personal computer forums, etc.)

> better and as well we need to be more vocal to the ARRL about our
> desires.

Seems to me this is a little mis-directed. The ARRL did hear the requests
of the membership in bringing up 90-55 to begin with.

The fact that they didn't succeed in staving off the actions of the FCC
can be blamed on many things, but NOT the ARRL not listening, or trying
to effect the FCC's decisions in a way consistant with what the membership
desired. You certainly can gripe about how effective the league was in
the above efforts, but they were in there pitching! If the league had
sat on its haunches during the 220 business, the handicaped issue, or
no-code then you'd be correct in your statement, but that doesn't describe
what they did.

As an example, in the 220 effort the league didn't have to do much
interpreting of what the members wanted to figure out that loosing the
band wasn't a good idea for the hobby. What they did do was 1) File
comments with the FCC against the propossal, 2) File reply comments on
UPS comments, etc. 3) Petition for reconsideration of the action
once it was taken, 4) Lobby congress to change the FCC's ruling(which
yielded a supporting resolution and a congressional hearing.) 5) Take
the FCC to court over their ruling. So they took the appropriate steps
in something approaching the appropriate order. You can certainly pick
holes in some of the efforts in this process(I know I can...) but to
say they didn't try, and they didn't represent what their membership
desires doesn't track from what I can see.

I don't know if the particular story be related is the one I'm familiar with but ....

Many moons ago down in the Santa Barbara area exactly this story did occur. I might get the players slightly mixed up since it has been at least 10 years....

Guy on his boat several miles out into the SB channel got in trouble as the weather turned nasty. For some reason he didn't use marine channels(maybe didn't have them..) and did have a working CB(sorta).

He called several times on Channel 9 but to no avail.... and finally reverted to keying the radio on/off sending morse code. Dave, W(A/B?)6RGJ, while monitoring channel 9 copied the signal and figured out what the guy on the boat was saying...HELP! Dave contacted the coast guard and got them to dispatch a boat to help the boat in trouble. Guy was picked up off the boat before it got swamped...

Brandon,

Your insisting that the statement "CW acts as a filter" be an absolute.
No-one ever claimed it was a perfect filter, just the best available(and
time tested...)

Now it's up to the OO's to clean up the mess that I expect to occur...
and there is only 650 of them in the entire country.

>HC901204.ZIP HamComm: Transmit/receive RTTY with PC/XT/AT

Oh, I forgot.. To save trouble for anyone else who might download
this program, the sample config file that comes with it has some
strange defaults that you'll probably need to correct. HC.CFG tries to
pick COM4 as the startup com port, and also disable COM1 from use.
Since COM1 was the only port I had available, this had me stymied
for a few minutes. Just pull HC.CFG into your favorite text editor,
and comment out these lines with a leading "#":

```
define port com4 iobase 0x3e8 irq 5
.
.
define port com1 iobase 0 irq 0
.
.
select port com4
```

Sure it has. That's why most of the ARF and BARF people have licenses
requiring 13 WPM or better, right?

My education in "good operating practice" and "friendliness and civility" came
from working rural 2m FM, and from working SSB DX (not pileups, but the real
thing), as well as ARES work. All voice.

90-55 came up only after the FCC took away 220. Those "requests" have been
there since the 1970s and the original communicator proposal.

>The fact that they didn't succeed in staving off the actions of the FCC

They ignored the input from the technical community which would have directly
addressed the concerns of the commission. Instead, they used the same,
tired arguments, most of which are no longer valid.

I think the days of the ARRL as the preeminent organization of Amateur Radio
are numbered...

It really disturbs me that this thread has been titled "A New Problem"
This (sadly) seems to be the typical reaction by too many of the Hams
out there in radio land. I hear the words "Filter", "QRM", and this gem
>"A message to the more virulent no-coders out there:
>
>IF WE GIVE YOU ALL OF THE REST OF THE SPECTRUM FOR NOTHING...WILL YOU LEAVE US
>ALONE ON 30 METERS?"

Well, before I'm convinced it's time to sink the ship, let me warn al who are
Ready to the stop the any new enthusiasm of no-coders, to stay away from
Rensselaer Polytechnic Institute, in Troy, New York, becuase we have already signed up 35
people for a quick one day session the morning/afternoon of
one of our Saturday Evening VE sessions. I mean, after Emag Engineering with
Professer Vlannes, and Circuit Synthesis with Prof. Close, these kids can figure out a Yagi
pretty darn quick.
Quote of the day:(from a EE junior)" are you sure there are no smith charts
OR transfer functions on this radio thing?"
And this is finals week! I can't wait for january.
The president of the electronics club said they may even eliminate their
VP-RF now that the code barrier has fallen, up at W2SZ.

This assumes that 30 meters is a CW only band. It is NOT!

There are only TWO band segments in ALL of the Amateur Radio spectrum that
are truly CW only:
50.0 - 50.1 MHz
144.0 - 144.1 MHz

FCC rules 97.305 lists the 30 meter band to include RTTY and Data.
Of course 30 meters is a NO-PHONE band, and I don't see any reason
to change it.

>CW "operating" has made sure that new Amateurs learned good operating practices
>along with the fundamental traditions of friendliness and civility.

Huh? I've been licensed since 1976, and I have yet to make a single
CW contact on the air. Shocking, isn't it! Are you saying that I
haven't learned good operating practices? I've certainly not learned
good CW operating practices, but that certainly isn't a problem for
me.

How will CW help me learn good ATV operating practices?

How will CW help me learn good phone operating practices?

How will CW help me learn good OSCAR operating practices?

How will CW help me learn good repeater operating practices?

How will CW help me learn good packet operating practices? Will it
instruct me that P-persistant channel access algrithms on packet will
keep the channel from falling into congestive collapse? Will it teach
me how to implement effective networking protocols to allow a
frequencey to be fairly shared amongst a community of amateurs?

I suppose that I wanted to learn traditions of friendliness and
civility, I could visit a church.

CW may have help Amateurs learn the tradition of CW, but I fail to see
how it has helped the rest of us pursue our own interests in amateur
radio. If you enjoy CW, have at it; but don't tell me that I somehow
cannot be a "good" amateur without baptism by CW.

The Commercial General license is a piece of wallpaper only. Used to be you
needed a 2nd phone license to work on anything, and a first phone for broadcast
but that was changed to where you need nothing to work on anything. Almost.
The commercial telegraph licenses for shipboard are still being issued, as a
ship operator may have to operate near some backward (1) country that wants to
make sure radio operators and technicians are qualified even though the great
U.S.A. don't give a damn. > >Also, is it legal to modify a CB to operate on 10 meter ham?

Since we hams can build our own stuff we can modify anything to do whatever we
want as long as we stay in our boundaries. CB and everything else is type
approved or type accepted, whatever.

Actually, the hell with 10 SSB with its incessant CB'isms. All I hear there
is "thats a big roger", "QSL this" "QSL that" " what's the personal" and
I never worked Pennsylvania before - send me a card and I'll send you one if
I ever get some printed. Get busy on the key. CW is the way to go.

These people aren't on 2meters are they? I decided to moniter 14.313 for the first time. As far as I'm concerned they all aught to be locked up.

I would be verry interested in efforts to get the FCC to do the job that we pay them to do, and enforce the laws. There is absolutely no excuse for the fedderal negligence in handleing this matter. It's gotten to the point where someone is going to get hurt, or killed, all because the FCC refuses to get off their lazy buts and end to this 14.313 problem.

(Sorry about the spelling, but I'm mad as hell right now.)

The first wave of new Techs will be families of hams, and people who have been on the periphery of ham radio for some time (e.g., serious SWLs), and I expect these people to be very well behaved and to respect what's valuable in the traditions of ham radio.

The next wave will be serious electronics enthusiasts and the like.

I think that CBification will not happen, because people who just want to talk on the air will be rather put off by the theory exam.
You have to remember that to someone with no electronics background, the Technician theory exam is not trivial.

And most of all, the process of studying for the theory exam will create a sense of commitment the same way that learning the code does.

Who is closer to the intended purpose of Amateur Radio...
the CW antiquarians or the VHF experimenters?

We all need to remember that the FCC doesn't give us spectrum to preserve
traditions. The FCC gives us spectrum (which it could easily have sold to
the commercial users, at *any* time in our history!) because of public
service, international goodwill, and ADVANCING THE RADIO ART.

]enhancers that are all the rage now. Would the next person to get nailed
]by one of those !#%$^! things try this as a defense and let us know how
]it worked (1/2 :-))?

The darn thing that lurks down the street from me in the pioneering photo-cop town of Paradise Valley, Arizona is manned (or womanned). I don't think it has anything to do with FCC regulations, but is more related to past experiences in Texas where the removal of spent lead projectiles and subsequent repair was a bit too expensive.

By the way - my 3 band radar detector DOES give enough warning to take corrective action if one is on the ball (and, heaven forbid, if one should exceed the 40 mile per hour speed limit on the 4 lane, divided, no stoplights for a mile road segment).

I'm pleased, but not all that surprised. I had previously speculated
that Ralph Haller (who was a reasonable, if slightly devious, person
when I knew him) put out the original proposal as a straw-man.

I do wish that they would have a different call sequence for codeless
(or is the PC term "lesser abled"?) tech licenses - it would make
enforcement work a little bit easier.

>not correct. Police radar cannot tell you where the target is; neither can it
>tell you which direction it is moving. Only the operator can determine that;
>and the device can only measure speed.

In terms of defining the "radiolocation" service, I do believe it is a braoder definition of "location" that is involved, and does include parameters of the location or position such as velocity, angle of movement, and acceleration. Just because the actual location is not derived (and is not needed because it is obvious where the car is) does not mean it can't fit under radiolocation.

>IMHO, it is important that none of these speed detecting devices solve the
>problem of speeders killing themselves or others a few miles down the road
>past the speed check points.

I suppose there is a prevailing believe that somehow this will eventually convince the speeding drivers to change their ways. In reality it is more likely a means (intended or otherwise) to raise money for the police (and lower the tax drain on the taxpayers who are not speeders).

If you want to bring this feeder into the shack, take out one of the windows and replace it with a panel made from Plexiglass, Lexan(tm) or whatever you can get hold of; then drill two little holes for the feeder. You then keep the glass to put back in the frame when you move house......
Alternatively, cut a hole through the wall, and fit a suitable diameter piece of plastic pipe; this takes small-spaced feeder quite nicely. Remember to plug the space between the feeder and the pipe, or you may find rain, snow, small animals (e.g. snails!), freezing gales etc. coming through the hole.

I wish you were right...but the canonical comment of those who operate between 27.405 and 28 MHz is, "I'd get a ham license if it weren't for that #$%@#$^ code." Those people will rush to get no-code licenses. That's what frightens me about no-code, and _nobody_ has yet shown me that that fear is unfounded.

I have the feeling from reading the last several posting about this new "problem" that alot of people are missing a golden opportunity. Hopefully, the no code Tech class will bring new people into the hobby (I say hopefully, because Canada has had limited success) and it's important that we teach them how to be good hams. I teach a Tech/Gen class and have for the past three years. My students are very young (10 - 14), retired or close to my own age (32) which repersents a good cross section of the population. The point that I would like to make is that they've all become good hams (I don't what to sound like I'm taking all the credit because there are alot of other people that have helped them) because someone took the time to teach them how to become a good ham. Instead of predicting the downfall of ham radio why not help someone become a good ham.

Now to get off the soapbox. Is there anyone else out there that teaches a class? I would like to exchange ideals with you. I can be reached here or at skitch@nadc.navy.mil.

If you're in the Philadelphia area classes begin Jan 8.

Well, Santa came a bit early and brought a shiney, new
Panasonic KX-P1124 (24-pin LQ dot matrix) printer for my
new DOSbox. The question I have is this:
What is involved in and what does the 32K memory
upgrade consist of? Is it just rams and a jumper
or is more involved? I haven't opened the case
yet (I have to wait for when the wife is out
of the house for a while before doing that) to
see what is/isn't there.
Can any of you provide any information on this item?
Thanks in advance,

Ron Todd, K3FR

I wholeheartedly agree with this philosophy and hope that all the other hams and OFs out there will do all that's necessary to WELCOME these new hams and show them the ropes. This is the only way they will become familiar with CORRECT procedures so that they don't try to invent their own. Come on, all you people who wanted no-code. Now's your chance! We're here to help you!

Why do people keep assuming there will be a sudden influx of lids? They're already here! Just they don't get that much notice due to the relative empty bandspace. All the influx will do is make us become more polite and tollerent.

When I hear the higher class licenses on 20M, where's your arguement? When I have a local extra who thinks it's funny to transmit on top of me (I call it jamming, he thinks it's "funny"), where is your arguement? When a local VE thinks pulling the PLL LOCK detect circuit out of his 2M radio does no harm, and is only to keep him in band, where is your arguement?

Give the new guys a chance, they are an unknown. The existing jerks are already well established, but you ignore them.

>
I think we will see people conform to the norms of the hobby
the good the bad and the indifferent. The norms more than the
exams will put the pressure on to conform. Also remember that
once someone earns something they have a tendancy to value it.

Remember a license still must be obtained by taking a written
exam. The exam still must be studied for ..... there is some
pride in passing and as such ..... I'll bet the fear of the
CB'er passes without many issues.

>>> Say, why do people use morse nowadays anyway?
>
>>For conformance with antiquated regulations, because they're old-fashioned,

The other remarks made by the various posters are all relevant and
(sometimes) humorous.

There is a point no-one seems to mention, the concept of "filtering
out the noisy".

Unfortunately it is not one hundred percent successful but it does
make a lot of difference.

Anyone who has listened to the quality of the conversations on both
amature radio bands and the so called "citizen" radio bands have
noticed the difference in the mentalities involved.

As long as the difficulties of learning Morse code in order to
get a licence, continues to keep to a minimum the number of the
ignorant and foul mouthed types allowed to use certain frequencies
I have no doubt it will be used.

The days when in order to use radio communication one had to build
ones own transmitter (and hence be intelligent) have (some might say
unfortunately) passed, and the result of allowing the only barrier
to this form of communication to be money or theft can be heard
on any CB channel. (shudder)

So let us hope that "the powers that be" keep obstacles such as
the technical exam and the morse code test, for the benefit of those
who can use radio sensibly.

I do not have an amature radio licence, but I know people who do
and on the whole they are better than the CB types who dont.

John.

> - Brian

The FCC has never been big on policing the Ham bands, preferring instead, to leave it to Hams to police themselves. This is IMHO in accord with the sacred views that government exercise as little control as is absolutely necessary over the activities of the people.

So, now comes Brian, who says that it doesn't matter which set of privileges have been earned by the operator. What's your call sign and class of license, Brian? Do you feel that there should be no class distinction? If so, why not just say it. Form a protest to change the current system to a classless system. At least, there'd be no need for self-policing the horrendous mess that now exists.

>PS: When is dube gonna go pound on whoever maintains his site's news

I lived in an apartment building once many years ago and solved that problem by carefully removing a pane of glass from one window and replacing it with plexiglass. I drilled that to suit myself for feedline bushings, etc. When we moved out, we put the original pane of glass back.

They don't get tired, either. In time of disaster, which is better, a technolgy based on humans who can only put in a few hours of intense activity before becoming too tired to be reliable, or a technology that patiently grinds away by the hour?

Cross-posted to: rec.ham-radio,rec.radio.shortwave

I saw an ad for a tape recorder from sony that would record and later display the time and date of the recording. It was listed for about $100 and appeared to be about the size of a walkman, with a LCD display.

* Has anyone seen one?

* Does it use a seperate track for this info?

* Are the tapes compatible with normal players?

* Is it any good?

I am thinking of getting a new logging recorder and this souded interesting. I was also considering the "double-speed" recorder that compresses the info while keeping it understandable. This new Sony though, with the voice synthesizer on the R7000 would provide a lot of information.

I will summarize any email responses. Thanks, jv

That's true now. The hangup is the FCC wants proof that it meets the specs.
Hence, certification of type acceptance.

> Also, is it legal to modify a CB to operate on 10 meter ham?

Yes, but it is NOT legal to convert it back again.

The only way to "gloss" the finish to
it's original finish is to repaint.
You can, however, use Armorall (spelling?).
It's the stuff that you put on your dash
and tires on your car. Turtle Wax also
makes a similar product. You have to
repeat the treatment every 2 or 3 months
to keep it looking good.

Those guys don't OPERATE CW. Anybody can pass the code test with tapes etc.
I should have said "use to" teach good operating practices as too many hams
today just pass the test and then start shouting into a mike.

>My education in "good operating practice" and "friendliness and civility" came
>from working rural 2m FM, and from working SSB DX (not pileups, but the real
>thing), as well as ARES work. All voice.

You said the magic word.. RURAL. I too got my first license in rural NH. When I
moved to the big city I was appalled by what I heard on 2M.

Further, virtually all DX you will talk to on the bands will be experienced
CW operators. Just ask them and ponder their answers.

Yep, I think this one is more interesting than the pizza wars. :-)
I'd like to hear some comments on scratch built VHF+ radios. Personally,
I would take a look at the kits put out by Hamtronics and Ramsey. They
are inexpensive and at least the new Hamtronics stuff works really well.
I haven't actually seen one of the new Ramsey 2 meter symthesized tranceiver
kits, but it sounds good in the ad. Circuit layout is not trivial at VHF+
and having a proven circuit board as a starting point is a big help.

If you really want to scratch build a proven design, check out "VHF-UHF
Manual" by Evans and Jessop. This is an RSGB publication that has detailed
designs for 2 meter transmit and receive strips that look fairly easy to
build. The "Manual" is available from the Ham Radio Bookstore. This book
is highly recomended for the bookshelf of any RF hacker.

4328. Did the FCC go Far enough this time .....

Newsgroup: rec.ham-radio
Date: 1990-12-18 17:25:34 UTC
From: magid@esis.enet.dec.com
Message-ID: <18323@shlump.nac.dec.com>
Source record: 5437

I wonder with all of the recent changes (technician and disability waiver) if the FCC has really gone far enough ?

1. Wouldn't it have been nice to see the FCC change the requirements for elements 1B and 1C to something like the following:

1A code @ 5WPM
1B computer operations (basic understanding)
1C computer " and theory (advanced)

2. The above would have conformed to the ITU regs and it would also have eliminated the need for the code waiver for the handicapped.

3. More important though it would help to a large degree advance the state of the skills used in the hobby and may have encouraged even more young computer oriented people to jump in.

4. RM ---- xxxxxx (do I hear a request for rule making)

It was an award for "Excellence" in contributing to the war-effort.

"Rah-rah"??? Do I detect a little cynicism here? As a kid, I collected milkweed pods for fliers' life jackets, collected rubber and scrap metal, and bought War bonds and savings stamps.

I also watched my church's service flag stars turn from blue to gold one by one and wondering if the 3rd star in the fourth row (my brother's) was someday going to be one of them. My brother's star stayed blue, but 8 out of 34 didn't.

So, my friend, be careful how you speak of a time when people still cared about more than their own amusement. "Rah-rah", indeed. [:-(

Amen!

For one thing, I think it will have a very positive influence at the college/university level. I know in my experience with the ARC here at Clemson, we have always had trouble getting students to worry about code AND theory when there was other unimportant thing taking up their time (like classes, homework, projects, football games, etc). It was always the code practice that seemed to be the thing that made people give up... the theory was never that difficult.

Now, with the code out of the way, they will be able to get a license and experience what ham radio has to offer. Then, hopefully, when the time and resources match the expectations, there will be enough good feelings about ham radio as a whole for them to want to learn code. It's almost like selling software... you have to show a demo, and let people try it for themselves. Perhaps this new no-code license will let people try ham radio and see what it has to offer.

And if all they see are a bunch of other hams expecting them to be a bunch of lids, well....

Cross-posted to: rec.radio.shortwave,rec.ham-radio

I wonder if someone could advise me on the feasability of
using shortwave to communicate with a friend of mine whilst
he is working at sea.

He will probably be sailing out of Japan to Brueni (sp?).
Is it possible to reach that part of the world from the UK ?
At all ? Regularly ? If so, what sort of kit would be best
(which band, output power etc.).

I am new to the world of shortwave broadcasting so please
keep the TLA's to a minimum.
Many thanks.

This is a most 'wonderful' way of welcoming the new-commers to ham radio. Perhaps we should insist that they sit in the back at club meetings, that is if we let them in the meeting in the first place. Pray tell what is wrong with the name TECHNICIAN? What is so great about element 1A that makes the person that passed it better than one that did not? It is stupid, bigoted atitudes like this that turn people off on the hobby.

you can get a used rock-bound HR-2B for $30, a HD4040 for $30 and use that
VIC20 with a homemade terminal program that you just had laying around!
Looks like about $60 to me.
You don't NEED to spend money on new stuff for packet or any other mode.

Oops. You forgot the cost of the Kilowatt amplifier and the rack of
antennas. The DSP moonbounce experiment required far less EIRP than
your typical CW bounce station. Frankly, a used PC with a DSP board is
less than half the cost of a used KW.

>Throw in interference in addition to noise, and I bet the human ear can
>beat anything anyone short of the NSA can build for a halfways-reasonable
>cost.

As a matter of fact, spread spectrum techniques do far better against
"interference" than noise. I can build SS systems for a normal SSB
rig that you'd have one heck of a time detecting with the naked ear
(and given the data rates, they'd be very cheap).

> Those who have never gone beyond barely learning enough CW to pass
>the 5 wpm test have a misconception of what a "good" operator can do.

Phil, Bob and myself are all beyond the 5 WPM stage.

>I have had the experience of visitors to my shack being utterly astounded
>that I could easily copy a signal that they considered to be completely
>inaudible due to noise and interference.

I've had similar experiences on sideband. "How did you hear that"? Yeah,
I'll take a well trained op any day over your typical 2m jawjammer, but
I know I'll never be as good as the machines.

>A complete packet station requires 1) 2-meter (etc.) radio, 2) TNC and

>under $100! :-)

An interesting Apples - Oranges comparison. Comparing new equipment to
used. And an AT at that -- which can be used for far more useful purposes
than the Viking.

A used TNC can be had for about $50. A used rockbound VHF radio can
be had for $30. A used terminal can be found for $20. $100.

tad@ssc.UUCP (Tad Cook) writes:

>How many of your friends who are interested in DSP, networking,
>etc (NOT just in yakking on 2 FM) are planning to get their Tech
>come February 15?

You will be surprised, Tad, at how much latent interest there is
in Ham radio around the hi-tech spots, with Morse code being the
main hinderance up till now.

A colleague who was studying Morse has now stopped and is simply
waiting for February to roll around. A friend in another company
who tried hard and gave up on Morse about a year ago has asked me
to wake him as soon as an exam session is available. These are EEs
who are as likely to homebrew as they are to yakking on 2m with a
storebought HT. Hey, these guys think the written tests are at
best a joke :-) It was situations like these that made me get off
my buns and write in to the FCC earlier (never lobbied any govermental
organization, for any cause, *ever,* before that).

There are also those who are more likely to just yak on 2m. A
tech in my group now wants a license (and he had to do Morse in the
Navy - but swore never to touch the key again). A project manager
whose XYL is a Ham now wants his license.

A portion of these folks will eventually learn Morse for the fun
of it or to be able to get on HF. Both the EEs have confessed that
to me. Technical folks who work with multi-megabit-per-second data
links in their daily work activity are sometimes too proud to *have*
to learn a mode of communications where you manually micro-manage the
makes and breaks of electrical contacts.

Is it unlawful to modify a ham rig to receive CB? I think not .....
The 11 meter band is available on many ham rigs with general coverage
receivers. ie : 0-30Mhz Icoms, Kenwoods, Yaesu do not block 27-28 Mhz.

As pointed out by others, transmitters for CB require type acceptance
certificates.

Decided I was not done. By the way what is your license class? I see you did not sign your note with you call. Perhaps you are only a TECHNICIAN. In that case I am better than you and get to sit in the front. I have a Extra class license. Guess what, I passed element 1c, but I will call them TECHNICIANS or TECH for short. As many people have pointed out and it is quite true, 98% of this hobby can be enjoyed WITHOUT knowledge of CW, so why adopt a better-than-thou attitude because someone did not demonstrate a barely literate ability of CW? And that is about it.

THEY ARE TECHNICIANS - PERIOD!

Are we going to discriminate against the present techs because they did not pass the old general exam? Thay has never been a point of discussion.

>CW operators. Just ask them and ponder their answers.
>
> AA6PN
Then again it depends on your definition of DX. I consider Chicago to
be DX, on 2304, of course.

Rich, thats not the central issue, CW is FINE for HF DXing, it's even required
for keeping microwave work simple and practical. I don't see what you are
complaining about, the HF bands will see NO CHANGE from this!!!!
Unless some of the new Techs DARE to invade your bands after learning the
code from (oh my GOD!!) tapes.
The upgrade path hasn't changed, to get use of the majority of HF privs,
you will continue to need 2,3a,3b and at least 1b.
To get ANY HF privs you still need to pass 1a!! You should be thrilled,
the VHF/UHF/micro group should be thrilled as they can bring in technically
competant people to all upper bands right away.
I mean, I do think parts of the new legislation are silly (like this valid forever CSCE
stuff for 1a) but hey thats life.
The worst part about this nocode liscence is that it has turned most of those
hold present (read:CW required) liscences into raving, argueing, crying LIDS.
(Come to think of it, I've just added fuel to the fire, boy can I screw up:-)

It's interesting that before the war (sometime around 1937) the War Ministary (British) requested the RSGB not to publish letters in "Radio Communication" regarding interference on 10 metres. The "Chain Home" RDF (later RADAR) operated around 30 MHz!

The "woodpecker's" grandfather was Watson Watt!!

The 12 pounds is not that bad (about the same as my Aussie licence) and
with a UK licence you can operate throughout Europe (CEPT countries) when
you visit. What kills me is that I end up paying about twice that rate
because the banks charge so much for the international bank draft!
When I was in Oz the bank charged about $3, here in the US its more than $20!
Does anyone know a better way to do it? Is it possible to do GIRO transfers
from a US Bank? Is it cheaper?

For 10.525/24 GHz in Ct, Va, and Dc, yes it is!
>It is not illegal to OWN a transmitter.
>It is not illegal to TEAR UP equipment (presuming it's yours).
>
>It doesn't take a lawyer to figure this out; all it takes is the ability to read
>and apply common sense.

Perhaps you should apply a bit of your own wisdom to yourself.

Regarding the CB service and modifying radios:

Title 47, Part 95

95.425 (CB Rule 25) May I make any changes to my CB station transmitter?

(a) You must not make or have any one else make any internal modification
to your CB transmitter.

further:

95.424 (CB rule 24) How do I have my CB station transmitter serviced?

(b) ... internal repairs or internal adjustments should be performed by
or under the immediate supervision and responsibility of a person
certified as technically qualified to perform transmitter maintenance
and repair duties in the private land mobile services and fixed services
by an organization or committee representative of users in those services.

For the Private land mobile radio services:

90.427 Precautions against unauthorized operation.

(b) ... no person shall program into a transmitter frequencies for which
the licensee using the transmitter is not authorized.

For the Aviation services:

87.73 Transmitter adjustments and tests.
A general radiotelephone operator must directly supervise and be
responsible for all transmitter adjustments or tests during install-
ation, servicing, or maintenance of a radio station. A general radio-

telephone operator must be responsible for the proper functioning of the station equipment.

I have read parts 0-19 and 80-97 exhaustively. I don't claim to remember everything I've read, but I sure remember that your above generalizations are not always true. The above references were gleaned from the regs by quickly glancing at the indexes of the individual parts. Please read the regs for other services before you arrogantly generalize and patronize other readers of rec.ham-radio.

> Ed Gilbert, WA2SRQ

Sure! When both paddles are squeezed, the keyer will make a repeating
di-dah-di-dah-di-dah, etc. If the paddle are simultaneously released
during a dah, a di will be inserted. If the paddles are simultaneously
released during a di, a dah will be added. This is "B" timing.

4345. Opinions on logging software needed

Newsgroup: rec.ham-radio
Date: 1990-12-18 20:11:23 UTC
From: Judith_A._Stonehill.WBST128@XEROX.COM
Message-ID: <"18-Dec-90.15:11:23.EST".*.Judith_A._Stonehill.WBST128@Xerox.com>
Source record: 5455

I'm looking for a logging package (running on an IBM PC compatible) which I can use in DXing and contesting, both in the VHF and HF bands. I'd like something which has:

- user defined dupe check rules (with easy exit if a dupe is hit)
- screen layout which is easy to work with
- user defined fields
- easy/flexible searching and reporting
- good documentation
- QSO notes (lots)
- control of some input by rig (not mandatory but nice)
- data import/export
- use of mouse (nice but not required)
- public domain nice but commercial OK too.

Has anyone had experience with a package which has some or all of these features? What do you like/dislike about the package? Any recommendations?

I saw an ad in the July 1990 QST for the Logic (as opposed to Logic Jr.) package from Personal Database Applications in Duluth, GA. Any opinions on this one?

All advise would be greatly appreciated.

73s,

Judy

Uhhhh....I thought the FCC stopped issuing the General Radiotelephone
License. Didn't they deregulate all this? And what does this license
have to do with type acceptance? I didn't mean that they derregulated
the process of type acceptance, but I thought that the license was
discontinued.

>We're here to help you!

Yeah, we gotta teach them the proper techniques for repeater wars,
jamming, endless discussions about traffic and the weather, how to
properly take an hour to describe your HT, how to set up worthless
"traffic nets" and the like. If we approach the new hams with the
attitude that we've gotta teach them the ropes as if they are
somewhat inferior, we'll be the losers.

I suspect that we'll be the ones to learn from the newcommers. Assuming
that we gently discourage the 11 meter/HF operating practices, we might
just learn a few things about using ham radio. I know that the people
I've been recruiting are the elite of the computer and commercial RF
industries. These are the people who have enough self-respect NOT to
submit to the CW initiation and instead have waited until the ham
radio rules gained some sanity. We've made that first important step.
We have some more to do before we achieve the ultimate goal - the
total elimination of CW as a licensing requirement but this is a start.

I think we'll be pleasantly surprised with the results of this change.
I can hardly wait to see what happens.

John

Probably the biggest incentive for my posting was the bold printed, red warning sign that came with my Uniden 2510 10meter rig. They threatened that if I ever modified my rig (added the jumper that enables CB) and returned it for repair, not only would they not repair the radio but they would also notify the FCC.

This bothers me. It's assumed that since I can use the radio on CB, I'm using the radio as a transmitter and have done something wrong.

> Luigi Giasi, KA1UTU, President of W2SZ the getting larger ARC of RPI

Don't get too excited. The code "barrier" hasn't "fallen" it's only
been moved back a significant amount.

But there's no going back now. For better or for worse, the requirement
has changed. It's somewhat ironic that the "self-policing" ham community
which has never had enforcement power will now be dealing with changes of
a large scale when the FCC has no police power either due to budget
limitations. Maybe there won't be any problems. Hope not. If there
are, it might be the excuse required to eliminate the ham bands and turn
over the frequencies to cellular services.

But, as always, abusing new hams won't help a thing. Welcoming them
is as much as we can do.

Welcome no-code hams!

(Just don't complain about "those funny beeps" on the repeater too often :-)

As someone who's seriously considering becomming a ham in the next few months (thank the FCC for doing something *right* and not putting the nocode above 220), I must thank all of you folks for being so warm and positive and supportive and making us potential hams feel very welcome. I can see why the hobby is losing people.

Be wary of self-fulfilling prophecies -- if you are antagonistic and obnoxious to the new and potential members, you'll scare off all but the stubborn (like me) or the antagonistic or obnoxious. No code is here. You can either pull together and make it work by bringing in the people you want, or you can scream and moan and bitch and complain and scare away everyone except the ones you're most worried about -- because they won't care what you think.

It's very literally up to you. If No code screws up, it won't be the FCC's fault. It'll be the fault of the people who decided it was no good from the beginning and worked to make it fail. You can either bring in the people that make amateur a good hobby and teach them to be good hams, or you can sit back and watch the idiots take over. Now's an important time for everyone concerned to get together and decide to do it right.

You're either part of the solution or part of the problem. It's the ground floor. Is your elevator going up? Or out?

>me about no-code, and _nobody_ has yet shown me that that fear is unfounded.
>

Just remember that most CB practice is the way it is because the status quo
for CB is *different* than ham communications. So if you hear 'CBisms' on 2m,
you might ought call the new ham (on the phone -- don't embarass the ex-CBer
by calling him a lid on the local repeater!) and *gently* inform him/her that
CB lingo is looked up as poor practice (due to its "uneducated" nature).
Hard feelings of amateurs towards CBers are also due CB's takeover of
the 11 meter amateur band (this is something that most CBers are not aware of).
Education is important to new amateurs -- this is something that older
hams can provide.

"Never explain by malice that which can be more easily explained by
ignorance". Note carefully that the last word is "ignorance", not "stupidity".
Given a chance (along with necessary knowledge) to make a correct
decision, most people often will.

>
>-=Paul Flaherty, N9FZX

I must be missing something here, Paul. Maybe you need to explain the
difference between "(en)coding" vs "modulation". I know that I could
implement a CW demodulator (or decoder ?) as a state machine that
follows a b-tree. Sounds pretty digital to me. I always thought a CW
transmitter was either ON or OFF, which also sounds distinctly digital.

I also observe that most digital demodulators (which are usually FM in
one form or another) employ analog technniques (such as slope detectors)
in the early stage of the decoding process. Like I've said, I don't
understand your distinction between decoding and demodulation.

As for CW being an AM mode, that's a bit of a stretch. While CW takes
on two amplitudes there is no information in the amplitude itself.
Also, the sidebands are zero-width.

** End of Quote **
A CB rig by part 95 rules may NOT be VFO or frequency-agile controlled but MUST be "channelized" so that it stays within the tolerances specified in Part 95...A ham rig on the other hand is NOT channelized....it can go where no man ahs gone before...provided it stays within appropriate band edges! and subbands/modes as well!
Also a CB may not put out more than 4 watts (yeah thats a joke...most CBs out of the box will do 10! and some more) but most ham rigs on 10 will do MUCH more than that....
CB to ham??? thats perfectly legal and being done all the time!!!

I have been following the arguments and comments about the introduction of the
no code licence with some interest.

It seems that this licence is essentially the same as what is called a
"limited" licence here in Australia, and has been available here for many
years.

It certainly did not cause the breakdown of amateur radio here, the home of
the oldest amateur radio society in the world. It did in fact attract many
new members to the hobby that had extremely good technical knowledge and
abilities that did not want to be bothered with morse code. Many of these
later gained the code qualifications so that they had access to the HF bands
below 30MHz.

The arguments being put forward against a no code licence have ALL been heard
before and experience elswhere in the world has proven then wrong.

Your comments about welcoming these new members to the hobby are well taken
and very timely in this argument. The hobby of amatuer has everything to
gain from the abaility of these people, many of whom will have better
technical knowledge and ability than those attempting to exclude them.

Just my $0.02 worth from a place where such a licence has existed for many
years.

GOOD LUCK TO ALL THE NEW AMATEURS!

Source record: 5277

As quoted from <18323@shlump.nac.dec.com> by magid@esis.enet.dec.com (Joel Magid...):
+---------------
| 1. Wouldn't it have been nice to see the FCC change the requirements
| for elements 1B and 1C to something like the following:
|
| 1A code @ 5WPM
| 1B computer operations (basic understanding)
| 1C computer " and theory (advanced)
+---------------

Too much emphasis on computers. I wouldn't mind seeing:

1A 5wpm code
1B digital modes (RTTY, AMTOR, packet, etc.) and computers
1C Video/facsimile (fax, SSTV, ATV...)

HOWEVER: if we do this, I would change these to endorsements. It doesn't
make sense to consider 1A (or, for that matter, 1B) a prerequisite for 1C.

I don't expect to see this any time soon; the FCC would have a screaming $#!+
fit over the paperwork. But it seems more rational than the current system
--- and it can be combined with an incentive licensing system if desired. One
that actually *provides* an incentive, by strong preference....

As quoted from <766.276A62DD@w8grt.fidonet.org> by jim.grubs@w8grt.fidonet.org (Jim Grubs):

```
+---------------
| After only two days since the FCC no-code Technician Class
| announcement, I have already started to receive requests from
| people intersted in getting me to revive the ELMER echo. What
| about it, all you Elmers, think we can make it go this time?
+---------------
```

Ncoast used to run a usenet-fido gateway before "ohionet" went away. We're still willing and able, and have at least two hams resident to help out (N8HSP Terry Bell and myself). And Terry's working on a packet gateway that could conceivably be integrated into it. (Now all I need is a spare computer and HF rig so I can add APLINK ;-)

>So the next
>project is too convert it to a 144 es 440 yagi. Anyone got any ideas?
>73, ted
>n6trf

I built the same project, and it works pretty well. 120 miles on an HT is so gratifying :-)

If you want 440, maybe just drill holes in the boom for the directors and reflectors and use bronze brazing rod. You could use a scavenged TV element for the split-DE w/ hairpin. There are element scaling equations in the ARRL Antenna book. The Antenna book also has equations for optimal long-boom yagis, which would make sense for the 440 yagi on a 6' boom.

Source record: 5280

I agree. I think that...

(1) There is no longer a national need for fast CW operators. A 5 wpm code exam is enough to make a ham "code-literate." After that, we improve our speed if and when we need to for on-the-air usage.

(2) There *is* a national need for people who understand computer communications -- *and* a need to attract computer enthusiasts into ham radio.

THEREFORE, I think hams ought to be able to offer exams on computer communications in lieu of the 13 and 20 wpm code exams!

>

I'm glad they didn't. Too many antiquarians are threatening to ostracize
the new hams.

Anyhow, distinctive call signs don't give you any information now.
KC4BDT is Extra Class; I (N4TMI) am Advanced; etc. Lots of hams keep a
lower-level call sign when upgrading.

4372. Build, modify, own (was: (none))

>
> >It is not illegal to MODIFY equipment.
> See below.

There are no quotes below that prohibit modifying equipment, in the
context of this discussion.

> >It is not illegal to BUILD equipment.
> For just about any other service, yes it is.

There are no quotes below that prohibit BUILDing equipment, in the
context of this discussion.

> >It is not illegal to OWN a receiver.
> For cellular phone without a service contract? Yes it is!

It is not legal to manufacture a receiver whose primary function is
the reception of cellular telephone. It is NOT illegal to OWN a receiver
which has the capability to receive cellular phone. If you truly believe
it IS illegal, you must immediately destroy your old television sets --
those with channel 83 -- or be in violation of the law.

It is not illegal to OWN a cellular phone without a service contract.
In fact, in CA and a few other states, Radio Shack is PROHIBITED from
selling cellular phones any other way. They MAY NOT force you to sign a
service agreement as a condition of sale. In this area, CA is
progressive.

> For 10.525/24 GHz in Ct, Va, and Dc, yes it is!

It is not illegal to OWN a 10.525 GHz receiver, in any state. It IS
illegal to USE said receiver in your automobile. Possession of said
receiver in a location where it may be used in a vehicle is assumption
of use. Possession in the trunk is not. It is not illegal to OWN an open
bottle of liquor, except for minors. It IS illegal to USE that open
bottle in your automobile. It is not illegal in your trunk.

> Regarding the CB service and modifying radios:
>
> Title 47, Part 95
>
> 95.425 (CB Rule 25) May I make any changes to my CB station transmitter?
>
Any radio not the CB station transmitter is not covered under this rule.

If the radio in question is not type-certified it cannot be the station transmitter. Any equipment built or modified, unless recertified, is no longer capable of being the CB station transmitter, and its USE as such is prohibited.

> 95.424 (CB rule 24) How do I have my CB station transmitter serviced?

Ditto above.
>
> For the Private land mobile radio services:
>
> 90.427 Precautions against unauthorized operation.
>
> (b) ... no person shall program into a transmitter frequencies for which
> the licensee using the transmitter is not authorized.

This rule does not prohibit the ownership, modification, or building of equipment. It prohibits USE, by a licensee, of unauthorized frequencies. If you are not a licensee, you are not covered.

If you read this rule out of context, it also seems to allow the USE of modified or built equipment, as long as you are authorized to use the frequency. This is certainly not true, as is stated in the original post, and is why taking rules out of context is very dangerous.

> For the Aviation services:
>
> 87.73 Transmitter adjustments and tests.
> A general radiotelephone operator must directly supervise and be
> responsible for all transmitter adjustments or tests during install-
> ation, servicing, or maintenance of a radio station. A general radio-
> telephone operator must be responsible for the proper functioning of th
> station equipment.

An aviation station is a very specific thing. Any equipment not part of the station is not covered by this rule. No aviation station licensee is prohibited by this rule from owning, modifying, or building any equipment he desires. If I owned an airplane (which requires a station license) I may legally add an amateur transmitter (which may be built or modified by myself) without the supervision of the general licensee, as that radio is not covered under the aviation rules (except for the mechanical considerations of weight and airframe modifications).

> I have read parts 0-19 and 80-97 exhaustively. I don't claim to remember
> everything I've read, but I sure remember that your above generalizations
> are not always true.

If you read the generalizations, as written, including the emphasized words, they are true.

If you include the entire context of the previous post, which clearly said that usage of the modified equipment was not legal, the generalizations are true.

If you include the context of the regulations you posted, the
generalizations are true.

> Please read the
> regs for other services before you arrogantly generalize and patronize other
> readers of rec.ham-radio.

Please accept the difference between OWN, MODIFY, BUILD, and USE.

Just as you would upgrade to the current Tech privileges -- take the
test.

> It is my understanding that the new 55 question pool will include questions
> from both current novice and tech question pools. Will he/she be
> required to take the new 55 question test which will include novice
> questions? I think that would make about 75 questions total ...

The test will have 55 questions. To upgrade, you would take a test of
55 questions. To walk in cold (no license), you would take a test of 55
questions. If you walk in and take the Novice test and decide that it
was horribly easy, and then take the Tech test, you will take the Novice
test, and then the full 55 question Tech test. You do not need to take
the Novice written test to be a Tech. You do not need to take the Tech
test to be a General. You need only 55 questions.

If you want the current Tech <30MHz privileges, you will need to take
a 5 wpm code test.

> 2. Does anyone have a phone number to the FCC for general info regarding
> Amateur radio?

Not off hand. Isn't it in the rulebook you keep by your rig?

Why not just get on the air, use a fake call, give out your name and
address, and interfere with as many commercial broadcasters as you can.
They will call you. ;-)

>
>My education in "good operating practice" and "friendliness and civility" came
>from working rural 2m FM, and from working SSB DX (not pileups, but the real
>thing), as well as ARES work. All voice.

I was under the impression that there were many Amateurs with impeccable
operating practice who never use CW.
Are you sure that it is "CW "operating" [that] has made sure that new
Amateurs learned good operating practices"?
And, is it really that hard to have poor CW operating habits? It seems to me
that you could operate CW on top of someone elses voice signal. All you have
to do is turn on that narrow CW filter and BANG! you can ignore everyone else!
Operating CW doesn't require good operating practice; it certainly doesn't
teach it.

You don't learn to be a good operator by using a specific mode.
You become a good operator by LISTENING to other good operators,
not by TRANSMITTING, be it in CW, AMTOR, SSB, or PACKET.

If you find it difficult to have good operating practice in any mode other than
CW, by all means, operate CW!
There are many other Amateurs who operate properly whatever the mode.

Maybe it isn't the mode or the code?!?

4376. Commodore Ham Software

Newsgroup: rec.ham-radio
Date: 1990-12-19 02:51:49 UTC
From: grx0644@uoft02.utoledo.edu
Message-ID: <1990Dec18.215150.2490@uoft02.utoledo.edu>
Source record: 5286

I have been reading the details about the no-code ticket and I was tempted to try for that ticket. Yet, I want to learn the code as well. Tonight I spoke to one of toledo's well known hams and he that years ago, when he had his Commodore 64 computer, there were programs that helped people learn code. I have a commodore 128 and I would like anyone who has any programs of this nature. If they are on any annonymous ftp sites, I'd like to know and if anyone can send them over the net. I am eager to learn my code and I programs of such nature can help me earn my ticket by allowing me to practice code.

Thanks in advance,

Tony

4377. Re: A New Problem

Newsgroup: rec.ham-radio

From: randall@informix.com
Message-ID: <1990Dec19.025502.27367@informix.com>
Source record: 5287

My question is: how many people will rush to get the new no-code ticket?
I think that most new no-code hams will fall into the following categories:

1. Friends / spouses of current hams

2. A few CBers who may have been intimidated by morse code

How many more people will this be? Not too many, I fear.

However, we in the amateur community have a great opportunity to
enhance growth in our hobby if we actively promote the new no-code
license. If the new ticket is actively publicized, we could see new hams
from other categories:

1. Elderly / shut-ins

2. Kids

3. People in the general public who may never have heard of
ham radio

4. Serious CBers who have heard little or nothing about ham
radio

I say ... let's DO IT! Let's pubicize the heck out of this new ticket.
A lot of people out there could experience the same fun that we have in
ham radio. Any hobby is better when more people are involved in it!

So CW *won't* get through better than other modulation methods after all.
Sorry to be snide, but I couldn't resist after all the pro-code claims.
Pirates are everybody's business and should be fought as strongly as possible.
Right now the FCC is still hacked about being taken to court by the ARRL
and seems unlikely to take action. If these turkeys can be located, perhaps
a hundred thousand letters sent directly to them complaining about their
illegal actions might help. You can count on me to write a nasty letter.

>A message to all who want to be able to enjoy the hobby in the future:

But telephone can't deal with many people at once without a party line.
And, besides, Amateur radio is much more fun AND works when the phone
lines go down.
If you want to talk to hams, what better place then on the radio?
I have only seen a few instances of jamming:
on CB
on repeaters
on the HF general portions.

When two individuals are talking without the aid of a repeater, it is
difficult to jam them since they can always switch to another frequency.
(Yes; they may have to have a backup frequency)!

Why should it frighten you? I've listened to those guys too, and to tell you the truth, I would have a hard time telling them apart from "real" hams. The lingo is the same, the conversation topics are the same, the equipment is even the same. :-)

About the only thing that gives them away is a) the inability to standardize on either USB or LSB, and b) the absence of callsigns.

Your ears must be better than Gary's.
If he couldn't reliably tell by ear that a signal was present then I very much doubt that he would have been able to copy the CW.

Here are some reasons why I'm glad that the FCC isn't making a new set of distinct call signs for the no code techs:

-there are enough classes of call signs already.
-he wouldn't have to give up his old call when he passed the code.
-anti no-coders might be rude, refuse to communicate with them, or even jam them.
-he's got full technician priviledges above HF, so what's wrong with his technician call?

Don't separate them from the experienced hams; bring them in, teach them what it is to be a good ham; let them teach you what they have to bring to this fine hobby-service.
Somehow I think that many of our parents and spouses are going to become licensed, now. I also think that they will do so in order to communicate with *us*. If we practice the good operating that we preach, they will be the very best of hams since we will be their elmers.
With these people, we can afford to fill the ranks of Amateur Radio.
We may not win back all of 220, but it sure is going to boost Amateur Radio's support in the government and in the eyes of the general public.
It will also boost our ability to respond in an emergency, since there will be more Hams available to turn out.

If you are worried about Amateur Radio becoming another CB band, why not become an Official Observer? These are the people, as well as every Amateur who operates according to the code of Amateur etiquette, are the ones who prevent Amateur Radio from becoming like CB.
If CB were administered like Amateur Radio, instead of like a free-for-all, maybe it would still be a pleasant place to chat.
If we work together to train the newcomers and curb those established bad apples, Amateur Radio will always be a pleasure to use.

Where did you get this one? The information I was given indicated
that all the FCC did in their meeting of 13Dec90 was drop the requirement
of element 1a for Technicians, meaning that the Tech 'test' would be
Element 2(the Novice element) and Element 3a(the Tech element), sorta the
first amateur exam to have two theory test, if you went in 'cold'. If you
went in with a novice, or had just passed the Novice (credit for 1a and 2)
that all you would do for Tech is take 3a...the same exam upgrade path
as always. But then again...misinformation is the word of the week.

Ah, you haven't used AMTOR then. I have dredged intelligence out of
the noise with AMTOR that I could not do with any other mode. I'm not
knocking CW....I like it a lot. But AMTOR is VERY robust on HF. Once
the ARQ link is established, if it can copy just an ocasional chirp,
the message will get through with no errors.

On CW or phone, the sending station keeps sending, even though you
may copy only 10% of the intelligence error free. ARQ AMTOR requests
repeats when it gets a bad chirp. Of course packet does this, but not
too well on HF in its present form.

Their wierd thing with AMTOR is that when the path is deteriorating,
I can still copy flawlessly (although slowly) when there seems to
be little if any audible signal there.

>Go ask your local high school baseball coach. I think most of them now
>use them to guage the speed of their pitchers' fastball.

If you are not a ham, you must license the transmitter in the fixed radiolocation service. This requires filing an application with the FCC AND having your choice of frequency coordinated (expensive). I recently contacted the local FCC field office and requested all forms that would be necesary to license a radar gun. I received a form that contained about 10 pages of fill-in-the-blank (forget the form number) plus a thick guidebook for filling out the form (!) plus a list of frequency coordinators.

Normally this licenseing is handled by the radar gun vendor as part of the gun sale. You as a citizen don't really want to go through the hassles. Just tune the gun to the ham segment of 10 ghz (or pretend you have) or just operate the K-band unit under your license since we share that band. Be sure and check the rules regarding operating beacons and rangefinding equipment. I believe you used to have to afix a printed callsign to the transmitter in lieu of other ID methods. BS true, but vital if you get hassled for "shooting" the local fuzz.

(BTW, you outta see a duty chief sputter when you walk in to a police station and ask to file a speeding charge against a cop and present radar evidence to back it up. :-) What's good for the goose.....

>There are only TWO band segments in ALL of the Amateur Radio spectrum that
>are truly CW only:
>
> 50.0 - 50.1 MHz
> 144.0 - 144.1 MHz
>
This is *NOT TRUE*!
Most of the World has *NO* 'CW Only', 'Phone-only' sub-bands. It is only
a result of the FCC licensing policy that the USA has these restrictions.
There is *NOTHING* in ITU regs. to give foundation to the US restrictions;
the restrictions are there through the whims of the FCC.

In most of 'the rest of the world', bandplans are by voluntary agreement.

Ok; I've got to get my two cent's worth in on this issue. One of the stated purposes of the Amateur Radio Service (and the one that seems to make the most sense from in the "big" picture) is to maintain a pool of individuals skilled in communications technology. In years gone by, if we found ourselves in a war, the military needed good CW operators and needed them FAST. Hence the CW requirement for ham licenses; it was completely correct and totally proper BECAUSE IT SERVED THE NATIONAL INTEREST. Hams offered this resource to the nation, and in return got to use valuable spectrum space.

So the CW question is easy to dispense with. Does a significant amount of military communication still use CW? Could a crisis arise today that would be more severe if no CW operators existed? If it could, if we still need CW operators, then the license structure should encourage CW training.

On the other hand, there are new technologies (satellite, packet, computer communications, spread spectrum, and so on) that I know for a fact are very important to the military these days. Therefore, the license structure should encourage skill in these areas.

I happen to think that the new codeless license gives too much for too little. The new Tech test, which is a combination of the old Novice and Tech tests, is a joke at best (I know; I just took the Novice and Tech). I have no objection to an "easy" entry into the hobby, but the privs you get for taking that route should be quite limited. New privs should be earned by becoming more competent in some branch of communications technology.

Sorry about rambling. To sum up, the procedure for developing a license structure should be the following:

1. Identify the nation's communications personell needs

2. Develop an entry-level exam that gives the licensee a basic overview of each of these crucial communications areas. This exam should be quite easy and would serve mainly to make hams aware of the broad field and ensure that they were cognizant of the rules and regs applying to them and of the penalties for failure to comply.

3. Provide a multi-ladder advancement program, whereby hams can gain more privs by training themselves in one of the specific areas identified in step 1. Each successive step should require more and more expertise in the area. Reaching the top of a ladder should indicate a profound technical knowledge of the area involved.

It is important to note that achieving high levels on one "ladder" should not entitle a ham to high privs in another area. He should have to go back and learn the new area from the bottom up. In this manner there will be an incentive for hams to become highly expert in many areas of communication theory. The privs associated with a particular area should be comensurate with the value the FCC attaches to that particular area of technology. For instance, if the government still needs CW, but not much, the CW ladder might lead to relatively modest privs. On the other hand, the reward for mastering an area that is extremely valuable would be very great (lots of spectrum space, high power privs, etc). Whatever works. Also, there is no reason that the value of various areas should remain static. From time to time the FCC should review the privs awarded for various skills and make suitable modifications. In this manner they will continually guide hams into the most important areas of technology.

In short, ham radio is a program for building the nation's technical resource base, not a freebie rag-chewing program. Let's keep things in perspective.

BTW, I zipped up the asbestos suit BEFORE I EVEN STARTED THIS MESSAGE, because I'm sure I've irritated somebody. I like code. I like computers. I passed the code test. Give me a break.

Kip

If I had a Uniden 2510, I think I would want to enable the CB frequencies,
but NOT in order to engage in outlaw CBing. Instead, my purpose would be...

(1) To LISTEN to Channel 19 in traffic jams and the like;

(2) To have one more place I could transmit in a real emergency.

But then I'm one in a zillion.

{The 12 pounds is not that bad (about the same as my Aussie licence) and
{with a UK licence you can operate throughout Europe (CEPT countries) when
{you visit. What kills me is that I end up paying about twice that rate
{because the banks charge so much for the international bank draft!
{When I was in Oz the bank charged about $3, here in the US its more than $20!
{Does anyone know a better way to do it? Is it possible to do GIRO transfers
{from a US Bank? Is it cheaper?

You might try opening an account in a foreign bank, U.S. banks tend to try
to "soak" you in any foreign currency transaction in my experience.
I used to have an account with Bank of Montreal (Canada) who would charge
$1 (CDN) for a foreign currency transaction such as a money order. The nice
thing is that the Canadian banks are almost all national banks so you can
open an account ANYWHERE in Canada and many U.S. cities! B of M also does a
lot of "bank by mail" too.

You DO have to declare the account on your income tax form and there are
regulations for large amounts of money (>$3K or so), but so long as you
aren't using the account for anything the government doesn't like there is
no hassle.

4410. The next step!?!?

Newsgroup: rec.ham-radio
Date: 1990-12-19 16:11:55 UTC
From: enders@plains.NoDak.edu
Message-ID: <7233@plains.NoDak.edu>
Source record: 5320

Ok, the codeless license has been approved. We should hopefully be on the way to the new 'Golden Age' of Amateur radio. But we are still burdened with the wonderfully complex license structure (even moreso now, with perpetual CSCE's, etc.) dictated by some well-meaning folks in the early '60's.

I think the FCC could colapse the current 5 amateur license classes into 3, plus eliminate the need for perpetual CSCE's and two classes of 'grandfathered' technician class licensees by doing the following (preferably, before the new tech licensing takes effect):

1. Eliminate element 1B from General and Advanced class license requirements. Replace it with 1A, to conform to ITU regs.

2. Make all Technician class licenses issued between 4/1/87 (or whatever date Novice Enhancement took effect) and 2/15/91 non-renewable, with a 2 year licensing period.

3. Suspend the issuance of new General class licenses, making them likewise non-renewable, with a 5 year term.

Now for the explanation. (1) instantly upgrades 'Old' Techs to General since they would have passed 1A, 2, and 3 (now 3A and 3B), and are on an equal footing with generals. (2) phases out the remaining Techs that have passed 1A, 2, and 3A. They either have to take 3B and become Generals, or revert to no-code Techs or Novice. When the new Tech test comes on-line, it should be element 3 (i.e. combine 3A and 3B again). (3) phases out Generals over a 5 year term. Either they upgrade by taking 4A to advanced, or they revert back to no-code Tech or Novice. We would then have the following license structure:

Novice: 1A, 2
Tech 2, 3
Advanced 1A, 2, 3, 4A
Extra 1C, 2, 3, 4A, 4B

Actually, at this point the novice ticket becomes a bit redundant, so it could then be phased out, leaving us with:

Tech 2, 3
Advanced 1A, 2, 3, 4A
Extra 1C, 2, 3, 4A, 4B

Although Advanced should probably be renamed to reflect it's status as the primary HF amateur license. You will note that this scheme keeps Extra. This is *not* an error! The Extra has always been a 'wallhanger' in relation to the privleges you get for the effort you expend. I feel it should be preserved as a status symbol, if nothing else. With less paperwork, the FCC

might even resume issuing the wall certificate type of Extra license.

The current Tech, General, and Advanced licenses have the most in common, and are the most likely candidates for 'telescoping' into one class. The upgrade route is simple, with most folks probably only opting to upgrade from no-code to the primary license. Them that want's Extra can go the route and get it, too.

What the hell's wrong with rah-rah? Do I detect a little hyper-sensitivity here? I call it rah-rah because it was an emotional appeal to pride of serving your country in time of war. That war effort was worth supporting in the opinion of a vast majority of Americans, myself included. And if you think that people today care only about their own amusement, you should talk to some of the kids over in HZ-land and their families.

So how about "Common Carrier Communication?" Did anyone on the net ever do it?

Source record: 5323

--
I recently got on the air for the first time with a Yaesu FT-101B - what a thrill! But I'm having a slight problem with tuning up the transmitter for SSB operation. With the meter switch on ALC, the needle won't budge from the full-scale position, no matter how hard I yell into the microphone (while connected to a dummy load, of course :-)

I followed all the transmitter tune-up directions meticulously, paying special attention to the adjustment of the ALC pot under the hood. Setting this correctly was a bit tricky - usually I'd transmit to test, the needle would pin-out to the right, I'd back the pot off to get full-scale, and then try again. Then the needle would be below full scale. It took a while to get a feel for how to set it so it would come up to full scale correctly when transmitting started. The fact that the pot setting seemed _real_ touchy right around there didn't help matters - perhaps the potentiometer is worn out in this spot?

In any case, my first (and, thus far, only) QSO didn't evoke any complaints about my signal quality, so I don't really know if there's a problem with the ALC circuitry, or just with the meter. I have some understanding of electronics but not much practical experience. The schematics seem to indicate that the ALC circuitry is very simple.

Has anyone out there had any similar experiences with this xcver? Any suggestions on what might be wrong or what I should check? I've got a good multimeter and a lousy oscilloscope, but no other test equipment.

I have been thinking about all of the reports similar to this that I have heard, and it suddenly dawned on me that perhaps part of the opposition to no-code was the desire of some to keep ham radio down at the slow, lotech level they can keep up with.

Any thoughts on this?

It would also make it easier for the mindless anti-no-code bigots. I think no callsign distinction is the better approach. This way people will get to know and like one another before an Old Fart finds out, "Oh, no, he's one of THEM!"

One thing about this bemuses me. Why do the OF's assume that THEM have any interest in talking to Buffalo Bill Code-y? We may very well have a situation now like in Jean Auel's "Clan of the Cave Bear", in which the "Others" are replacing the "Flatheads" as the dominant anthropoid species.

> >

No it isn't! Not unless you have no inhibition about relieving yourself
into the lavatory!

Ask directions for "la toilette" or even "le W.C." (this latter Anglicism
has crossed the Channel and is apparently widely recognized in France).

And be careful in taking a French hotel room. If you get "une chambre avec
salle de bain," you get a room with a bath--but not a toilet. Look for
"une chambre avec salle de bain et toilette" if you don't want to share
a W.C. with strangers.

France is a *beautiful* country; be certain to get *away* from Paris to
get to know the charms of its villages and farms. I found France to be a
wonderful mixture of the modern and the ancient, and the only rude French
I encountered were Parisians (or is it "Parisites?" :-) :-) :-))

Look up the words. Ham is better than amateur at describing the hobby.

> As part of the structure enhancement rec.radio.amateur.satellite might do
> some good towards the end of distributing some of the traffic.

But there has been NO suggestion of r.r.a.s. You are right --
changing the structure will distribute the traffic. The ONLY structure
change is adding the .legal subgroup, which is NOT dependent on changing
anything else. Adding r.h.l will have the same effect as changing the
name and adding r.r.a.l, with less work for all.

> > There is still no evidence that renaming the group will make it better.
>
> There is no evidence it WON'T make it better either.

If there is no evidence either way, why bother to do it at all?

P.S. Alan - your system is mis-configured. It is delivering mail to the
wrong places and abusing net resources. Fortunately, I was able to stop
mine from automatically correcting your error and resending it. You
should fix yours, I might not catch it next time.

Slight correction on terminology....There is certainly some "CW-Only" portions of amateur spectrum as set up by US regs, but there is no such thing as "Phone-Only", i.e. I can use CW anywhere in the amateur spectrum. There is only custom saying I won't do that.

I heard that RF Parts sells some VHF RF amplifier modules. Apparently
all you need is a heat sink, DC supply, and a transmit receive switch.

It does not. Not in any sense of the original meaning. Perhaps there are a few actual hams left, but their number is so small as to be in the noise. What we have today is something approaching what was called 'CB' circa 1970. 'CB' has deteriorated since then. So has amateur radio.

That was bottled up. What you saw was just what leaked out!

This is getting ridiculous. The deed is done, and regardless how people feel, they'd better make it positive.

Just the other night on a local repeater this was discussed, and this one .....INDIVIDUAL..... (I'm bottled up again!!) started talking about no-code in HF ruining the hobby and about international treaty. I TRIED to be polite, but after about 4 exchanges he INSISTED about moaning about how it was protected by treaty. I signed. You gotta remember about arguing with a rock. Teaching a pig to sing just annoys a pig, and he still won't sing. The rock won't even get annoyed.

But what got me was the attitude that HF was 'protected' and his attitude of CW is HAM radio.

Unfortunately this will drive the CBers up to 28.000 and above destroying the
CW portion of the band. They are already transmitting there now and making
portions of the CW band unusable.

My impression is that it is very difficult to get permission to
operate an Amateur Radio station from a commercial vessel. You
can't just use the ship's radio on the ham bands, because by law
(at least for US-flag vessels) the Amateur and Commercial
apparatus must be completely separate.

You can always send a message by commercial ship-to-shore
radio. Don't know what it costs. If it's a small ship it
likely will be sent by M**** c***. :-)

I wouldn't add trickle charging to my HT.
The ability to run the HT directly on DC without charging the battery is one
of the big reasons why I chose the TH-75A over other models!

When you say that "NiCd cells don't have a memory problem" do you mean that it
is not damaging to discharge them somewhat and then recharge them?
(recharging them when they have not been discharged to their rated discharged
voltage, but not OVERcharging them)
Also, is it really that damaging to leave NiCds on TRICKLE charge, let's say
6 ma for a 600 ma/H battery?

4435. Chebychev Filters

Newsgroup: rec.ham-radio
Date: 1990-12-19 20:04:19 UTC
From: kipper@ccwf.cc.utexas.edu
Message-ID: <41662@ut-emx.uucp>
Source record: 5245

Hi. A quick question about Chebychev low pass filters. The ARRL Handbook says that the passband SWR depends on the passband ripple (bigger ripple, bigger SWR). My intuition tells me that that would only become a problem if you actually used the filter all over the passband; SOMEWHERE in the passband the high SWR would occur. If I'm running at a single, crystal defined frequency, can't I tune my antenna for good SWR regardless of my filter?

Also, a more theoretical question on filters. A low pass filter prevents high frequency energy from reaching the load. However, the filter is comprised only of inductors and capacitors, so it can't dissipate that energy. Furthermore, the filter components can't store it either, since that would result in a long term uptrend in stored energy which would violate the assumption that everything is steady state. The only place left for the energy to go is back to the source. So apparently a filter really functions as a reflector in its stopband, sending energy back to the source rather than allowing it to reach the load.

Of course, this means that the source must absorb all of the stopband energy. I'm building a QRP transmitter that filters a square wave to get a suitably pure sine wave. That's no problem. But if I add a power amp stage to get more power later, I think this means I should amplify the sine wave rather than the square wave. Because if I amplify the square wave and then filter it, the amplifier output stage will have to absorb the now amplified harmonic energy. Right?

Any feedback will be appreciated!

Thanks,
Kip Ingram

In perusing my copy of Part 97, I find paragraph 97.119(e), which says,
in part, that operators who are using privileges based on a CSCE must add
an indicator of this following the call sign. The Technician indicator is
KT.

I used to hear this all the time. "KA1XYZ interim KT." "N0ABC temporary
AG."

Has this part been rescinded, or is it just being ignored?

4441. Help: Optimal Coil Geometry for Metal Detector (+ideas)

Newsgroup: rec.ham-radio
Date: 1990-12-19 20:55:08 UTC
From: G.Moretti@massey.ac.nz
Message-ID: <1990Dec19.205508.13947@massey.ac.nz>
Source record: 5251
Cross-posted to: sci.electronics,rec.ham-radio

Hi
I'm making a metal detector for my son's birthday - you know the sort of thing that it's obvious how it works and you just whip one up in an evening :-) Well I did that and I have a few questions ...

I'm using the two oscillators at about 300KHz mixed together and listening for the beat note. One of the oscillators is fixed and the other has the search coil as its inductance, so that its frequency will vary when metal is bought close to it.

I've prototyped it last night and it seems to work but it's not as sensitive as I'd like. When the oscillators are about zero beat (or close) you can detect (" denote INCHES):

(The round coil has about the same inductance as the oblong one - I didn't count its turns)
COIL Shape and Turns

OBJECT 15Turns 4" x 6" 4"diameter
3"*3" PC bare PC board 5" 4"
Bean Tin 5" diameter 7" 5"
Coin 1.5" diameter 2" 1"

The coil shape obviously has a marked difference on the sensitivity - what is the optimal shape and screening (ie should the coil be round, square, oblong, a spiral to encompass a lot of area, shielded)?

I'm aiming to be able to detect objects at greater distances that the above. Obviously the type of metal has an effect but there must be some general guidelines. Do you need different shaped coils for maximum sensitivity with different sized object? One magazine article suggested that the sensitivity was related to the ratio of the object size to the coil size, but didn't give any further guidelines :-(

The frequency I'm using is sort of mid-range, I didn't want to go too high in case the metals are too lossy - I know this sounds sort of vague, but I know for example that you don't use a nail as core for RF coils :-) Would a higher frequency be better?

The other sort of metal detector I know of has two coils are right angles to minimize the coupling between them, until some metal comes along. Is this type notably more sensitive?

A friend has just come in and suggested using a phase comparator as in 4046 VCO chip instead of listening to the beat note - Seems as though this might be too sensitive ???

Gian, my son is only seven and would be happy with the current
version, but _I_ don't like not understanding the things I build :-)

Any suggestions would be welcome.

Thanks
Giovanni ZL2BOI

Sorry, but I and the local VEC disagree with you on this. The
55 questions represent a two-part exam comprised of the existing
Novice exam (30 questions) and the exisiting Tech exam (25 questions).
If you have credit already for element 2 (the Novice written)
you only have to take the Tech written.

The exam structure has not changed. Its just that elements 2 and 3
will get you a Tech license in mid-February.

I wonder with all of the recent changes (technician and disability
waiver) if the FCC has really gone far enough ?

No. They should remove all voice privileges from 20 meters and make it a
digital only band (for the U.S.) like 30 meters.

That would solve lots of problems.

You know, I thought now that the FCC had finally acted and created a class of license that did not require CW, the endless debate would finally come to an end.

I was wrong. :-(

Message-ID: <9158@scicom.AlphaCDC.COM>
Source record: 5257
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Every Saturday afternoon National Public Radio brings you
Car Talk starring the click and clack brothers Maliacci (sp?).
Each week they give a stumper question the answer to be
reveiled the following week. Most of the questions are about
cars but last weeks went somthing like:

A woman brings in something electrical to a repair shop.
The repairman says: I haven't seen one of these for awhile.
they used to be illegal.

A group of us brainstormed that one for awhile but didn't get
close to the answer, even though one of us is a SWL.

The 1990 Passport to world band radio has an article concerning
forbidden listening in various countries. It says that during
WWII German and Italian nationals (not citizens) in the US
possessing SW radios were required to surrender or render the
SW bands inoperative.

But did this apply to US citizenry at large?

>just say it. Form a protest to change the current system to a classless
>system.

My primary station callsign is WB6CYT; it's a Technician operator class
and has been since I first became a ham 20 years ago.

Yes, I believe in a classless amateur radio service.

I've sent you a copy of my filing with the FCC under a separate cover;
those paying attention have seen it posted here before so I won't
inflict it on them again. Briefly, it maintains that there should only
be two classes of license - one with code to satisfy international
requirements for operation below 30 MHz, and the other without code.
Both would have a simple exam sufficient for the applicant to prove
that he knows enough to operate a ham station without causing
interference to others hams and services - NOTHING MORE IS NEEDED. I
propose that the ARRL issue technical certificates of achievement (just
as they do now for code proficiency) to appease those who need paper to
document their achievements.

As you requested, a copy of the appropriate Usenet RFCs are also on the
way to you; you'll find in there the requirement to include a subject
in the posting of a message, which your broken news software isn't doing.

I must disagree. IMHO, much of the opposition is due to the "because I went through this shit, you must go through this shit" syndrome. This phenomena is most clearly observed in the treatment of medical interns/residents but can be discerned here also.

To put in my $0.02, I am not in favor of dropping or lowering code requirements. The only reason why I got my Tech license was because of the challenge of learning code. IMHO, the fun would be lost in upgrading if the code requirements were eliminated. Most of the sense of accomplishment is from the code. The theory is bullshit. How could it be otherwise when the FCC gives us both the questions and the answers?

Of course, this is only in my case. Others may (and probably don't) find satisfaction in the challenges of learning code. Oh well. Hopefully, I will have the time to work on my code speed and take the General exams.

>up. Seems he just wanted to give up fighting for the rights to own FM.
>
>Too bad. If he lived, he could've seen that he won in the end, and see
>the rise of FM in this country.

If I remember correctly, he had lost his patent battle with none other
than the mega-conglomorate RCA (with whom I was employed when I read
Armstrong's biography). His widow won back those rights in the '60s
(if I remember --- can someone with the book handy correct me?).

At the time, the late great RCA had a team of stratospherically priced
lawyers who were very good at proving RCA engineers had invented everything
RCA felt it wanted. Armstrong was one of many victims.

However, on the positive (or humourous) side -- I remember having a
conversation with one of RCA's chief scientists before the demise of the
company at the hands of neutron Jack. Our conversation took place in
1981 if my memory serves me. The scientist said that RCA had just discovered
in its archives that it had "the" patent on video text. That is, any textual
display on a cathode-ray tube. It seems it was invented by an RCA radar
engineer during WWII to help mark data on a radar screen. RCA had never
sought to enforce the patent, and even though it had been renewed through
the standard procedures the statute of limitations on that sort ofthing
had run out. RCA had 3 months with which to bring its case against all
manufactures of computer peripheral and display equipment to try to collect.
He had been brought in as the "technical expert" to testify.

Naturally, RCA didn't stand a chance. However, some of the companies
threatned by RCA's suit decided to settle anyway..to the tune of several
hundred million American Samoleans.

Then, of course, GE came in and tore RCA to shreads in good old American
Entrepeneurial style and left only scorched earth. So, much for good old
General Sarnoff and a lot of people involved in the beginning of radio.

It was kind of a neat place to work, for a while.

No puzzle! The General Radiotelephone license requires a heckuva lot more
technical knowledge than the General class Ham license, but no CW or oper-
ating practices knowledge. But then it doesn't convey the Amateur privileges.
Always wondered why it was that the G.R.T. holder can work on all sorts of
transmitting equipment, yet couldn't even use Novice privileges. Certified
technical prowess apparently isn't the only requirement for being a Ham.

My comment was in direct response to the statement that "there is no national need for fast CW operators." The Navy officially disagrees...else they wouldn't offer comparatively high-grade enlistments to CW operators.

Further, I'll point out that ham radio has historically been the military's farm team. Why do you think they're so high on ham radio? It's not just because of the frequencies we could make available to them...

>to talk on the air will be rather put off by the theory exam.
>You have to remember that to someone with no electronics background,
>the Technician theory exam is not trivial.
>
While the material itself is not trivial, the exams are. There is
living proof right here on this net that you can get a tech and above
without any real technical knowledge. All you need is the ability to
memorize. Check it out. Round up 25 ticket-holders and give 'em a
no-notice exam for their class of license. See how many pass.

>And most of all, the process of studying for the theory exam will create
>a sense of commitment the same way that learning the code does.

I'm still skeptical. Suppose there is a big hue and cry to eliminate the
theory exams? (to get more people into Amateur Radio, of course)
CB-ification will have been achieved. Can't happen, you say? Well, they
said a No-Code Ham license would never happen several years ago. Never say
Never.

Cross-posted to: news.groups,rec.ham-radio

The proposal looks pretty good overall. It definitely makes sense to unify things under a `rec.radio' category.

I don't know about replacing `ham' with `amateur'. I think most people would call themselves `hams' and not `amateurs'. Besides, `ham' is easier to type. Basically, it doesn't seem to me like there's a good enough reason to change it from what it was. But i don't think it makes a big difference either way.

I think that it'd be useful to have a separate `tech' group. Questions like ``What sort of cut-off slope can i get with so-and-so filter?'' don't really belong in a general group. Regarding flames, the `legal' group is supposed to take care of that, so i don't see why that should stop us from creating another group. And regarding gatewaying, i don't see why both groups couldn't be gatewayed together. The mailing list members need never know there are two separate groups.

Finally, i'd recommend that the left-over group be specifically called `misc'. I think this encourages people to classify their discussion into the right group, rather than just dumping it all in a parent group. There's already at least three subgroups, and most likely more will be added in the future. So we might as well do it right to start.

Therefore my proposal is the following:

rec.radio.ham.legal
rec.radio.ham.misc (from rec.ham-radio)
rec.radio.ham.packet (from rec.ham-radio.packet)
rec.radio.ham.swap (from rec.ham-radio.swap)
rec.radio.ham.tech

4460. TH-27a AM mode info

Newsgroup: rec.ham-radio
Date: 1990-12-19 23:32:45 UTC
From: jpd@pc.usl.edu
Message-ID: <21115@rouge.usl.edu>
Source record: 5270

TH-27A AM mode info, obtained from N5OFF, who got it from Kenwood:

When the TH-27a is placed in the AM mode, the microprocessor sends control information to IC1 on the RF board. The microprocessor also turns on Q210 on the IF board. IC1 tunes the receiver front end band pass filter circuits and turns on Q4. Q4 passes the 5 volts supplied from Q210 to the AM circuit on the IF board.

The AM circuit board (x58-3750-00) contains IC51, Q51, Q52, and Q53. The AM detector, IC51, receives the khz IF signal from the IF filter CF201. The AM detector passes the recovered audio to amplifier Q53. This transistor passes the amplified audio to the transceiver's squelch and audio circuits. Amplifier Q51 provides agc to IF amplifier Q41. Transistor Q52 is used to turn off the FM detector circuits when the transceiver is in the AM mode.

The radio is placed in the AM mode by holding the f key for 1 second, and then pressing the mhz key. The AM range is restricted to 118-135.995 mhz, retaining step and squelch functions. The AM actually sounds quite good for such a small speaker, and sensitivity appears to be as good as an airband scanner on a comparable antenna.

>code." Those people will rush to get no-code licenses. That's what frightens
>me about no-code, and _nobody_ has yet shown me that that fear is unfounded.

I hear what you are saying ... that all those screwball CBers will jump up
to 2 meters now that we have no-code. You may be right, but I disagree.
The same argument was made against the ARRL's pre-WARC-79 recruitment
effort, which concentrated on CBers because of the 70's CB craze.
Ham radio did not shrivel and die, and very rarely was the word "breaker"
heard on any band but 11 meters.

I just don't think the mentality of some of those folks is right for ham
radio, so they won't be interested. They're happy where they are. They
don't need or want a stricter environment. Can you imagine a conversation
like this on CB:

HIGH STEPPER: (whistle into the mike) Ahhhhhhhdeeeeeooooohhhhh ah break
breaker, breaker, breaker, good buddy, this be the one duck-pluckin'
high-stepper, wall to wall and treetop tall. Rubber duck, ya got yer
ears on?

RUBBER DUCK: Dat be fo' duck-puckin' sho', high-stepper. Ya hear dat
ders a new license for ham radio where ya don't need to know dat morse
code stuff?

H.S.: Dat's a big 10-4, good buddy. Say, lez say we go down to da
Ham Radio Outlet and buy us an Icom, so's we can work dat 2 meter band.
I'll bet we'd be able to find more Smokeys with dat 2 meters. And we
probably be able to talk more skip too.

R.D.: Dat be for duck-pluckin' sho! Will my black box (linear amp)
work on dat 2 meters?

Something tells me that such conversations are NOT gracing the CB band
today.

My wife (yes, she does crossword puzzles with a pen), upon hearing about the no-code Tech license, said "But I don't want to talk on the radio, I just want to learn Morse Code !". After achieving Tetris level 9 height 4, she's looking for a new game. I gave her the "Tune in the World" tapes. I'm curious to see how far she goes.

The other funny part is that she feels less confident about learning the technical stuff (which was trivial for me). It takes all kinds, I guess.

My call - KB0HBX - is a general call. How does someone not mistake it for a novice call? (actually, I'm getting a new one since I made advanced - my own incentive as it were).

Jeepster@cup.portal.com Who, me?

Correct. Take Canada for example. You sometimes hear Canadians
on "CW-only" frequencies in the U.S.

Restrictions or not they are CW only subbands as per Part 97....Your answer
seemed to imply that the originator of the subject was incorrect in stating
that 50-50.1 and 144-144.1 is CW ONLY (which they are! I didnt realize that
until I looked in the rules...hmmph..guess you do learn something everyday..
CW at 6 and 2??? Guess the Gonsets have a strong lobby!)

I have seen one, but have not yet purchased. They have a model
that takes standard cassettes and appear to have a model that
is similar that takes mini-cassettes. The model I looked at
(standard cassettes), does not have a line input, does not
include a AC adapter and sells for about 90.00 (list is higher).
The place I saw it could not find the manual and was too busy
for demoing, so there is much about the unit I don't yet know.

I don't know where the time stamps are stored. I hope they put
a digital burst on the other track of a stereo pair, but
I am just guessing on that.

The thing that has me bemused and amused is the tacit assumption in many ham circles that new no-code hams will be of lower caliber than existing hams. All the talk I've heard is that the 'new' techs may be better and conceivably turn out to be the ones who look down their noses.

It just dawned on you now? I've been picking up those vibes since the debate started. Plenty of hams are _afraid_ of an influx of more sophisticated technical people. They're afraid that this would raise the standards of ham radio to the point that people who don't know how a radio works might find themselves out of place no matter how fast they can send code.

You have to remember that the no-code license was the FCC's idea and the
FCC was definitely not catering to outlaw CBers or slackers. The FCC
was trying to deal with the fact that nowadays, our best electronics talent
is not being attracted into ham radio.

People forget where the no-code proposal came from. The FCC has been
talking about it since 1940 and, until now, had been shouted down by
the ham community every time.

> > Where did you get this one? The information I was given indicated
>
> I got it off THIS newsgroup.

Absolutely correct. The new setup-to-be:

Novice: elements 1A (5 wpm) + 2 (30 q. Novice)

Tech: elements 2 (30 q. Nov) + 3A (25 q. Tech.)

Tech + 1A = (current Tech) Novice & Tech privileges

Novice + 3A = --- same thing ---

My only complaint is that the Novices still aren't in the V.E. program.
Too many Novice tests have been bought or given away.
Even the V.E. sessions are a bit lax at times - some groups more than others.
One, remains unidentified here, regularly passes those who fail miserably at
other local sessions. If anyone wants more info, post a request.
There are plenty of Extras what shouldn't be.

Sounds good to me.
This got me thinking of some differences between CB & HAM and that help make HAM operation well behaved. Certainly the pride and value of having earned the privelidge to be a HAM radio operator as mentioned above is a difference. Even the words "HAM radio operator" seem special to me. Another difference is having a authentic callsign and being required to ID, as opposed to picking a CB handle.
I never did decide on a handle for myself when I was trying out CB. I was dismayed by the number of people who weren't practicing good CB operation, and I felt intimated by them. Plus I couldn't really think of anything to say.....not a really good environment for someone who's trying to overcome shyness. Anyway...I don't want to put CB down. I'm just thinking of why the VHF & UHF HAM activity I've heard seems well behaved to me, and why the chances of hearing well behaved CB activity is a rough _maybe_. The combination of pride, rules, and interest in radio seems to make quite a difference.

I took the Novice & Tech. tests at the end of November, so I'm anxiously awaiting you know what in the mail. I hope I enjoy being a HAM, and I sure hope I think of something to say for phone activity! :-)
I'm going to get involved in packet, and I'm also interested in trying out CW.

I hope the new codeless Tech. class does good things for the popularity of HAM radio....seems like it will. And hopefully it won't cause the problems some people are worried about. I think the codeless class makes sense because there are so many worthy things to do in HAM radio that take time and energy to learn, and if someone wants to spend time & energy (& money! :-) on phone, packet, etc. instead of on CW, well hey, that's fine with me. It could make for all the better non-CW type operator. Just don't judge for other people the value of CW or any other mode. If someone likes CW and you don't, well then that person values CW and you don't. That's all.

Me, well I'd like to try a little of everything.

The General (Comm'l) license is just wallpaper as someone else put it. No
license at all required to work on domestic radios other than amateur.
And in my posting I referred to the Amateur General license. I don't think
the General phone was even in existance when the FCC still gave ham tests.
And even so, if memory is correct, they never tested for General, but only
gave that insignificant certificate to those who wanted it and whose 2nd or
1st phones were up for renewal.

So guess again.

]negligence in handleing this matter. It's gotten to the point where someone is
]going to get hurt, or killed, all because the FCC refuses to get off their lazy
]buts and end to this 14.313 problem.
]
The problem is NOT the FCC. It is the congress, which does not allocate the
FCC enough money to fund any significant enforcement. All you have to do
to confirm this is listen to the "sidebanders" between 10 and 11 meters.
They are blatant as hell, but few get caught.

Another thing to consider is that a lot of this stuff is not, in a
larger sense, very important. Is it more important to catch and
punish a robber or a jammer? This is, after all, a hobby. Jammers and
other turkeys (KV4FZ, K1MAN, BARF, etc) are
annoying as hell, but except when one is handling traffic, they are
not much of a hazard to society. I consider them to be more like
vandals - they destroy something we value, for no good reason, but
are not particularly dangerous. We'd all like to make them pay, but
how much are WE willing to pay to do this?

There are exceptions where jammers are dangerous. When I have operated
as net control on the Hurricane Watch Net, I have been badly jammed,
and it has hampered net efficiency - which could cost lives. I am also
aware of 3 incidents here in AZ in which potentially life saving calls were
prevented by a jammer (now deceased, himself) - all of these incidents
ending in the deaths of the victims. This sort of jamming is more dangerous
and more deserving of prompt and serious FC action.

>and on the whole they are better than the CB types who dont.
>

The average age of amateur radio operators is 50. The average age of CB operators is between 20 and 30 (no one knows for sure since licensing for CB is now nonexistant). The number of CB operators is at least 10 times the number of amateur operators and they are all crowded into 40 channels. The classic generation gap between the more mannerly oldsters and the young rowdies is a reflection of social change not differing licensing requirements. The huge numbers and the extreme crowding make the problems heard on CB seem much worse than they are. If you confined your amateur operations to 14.313 Mhz and certain portions of the 75 meter band and certain 2 meter repeaters, you would think that amateur radio was as bad as CB.

We must wake up to the fact that amateur radio inevitably will face the effects of social change as the older generation dies off and new blood trickles in whether there is a code test or not. Now that there is not a code test for one class of license, this trickle may accelerate a bit. We must prepare to deal with these changes. Fortunately, we still have a bit of room so the intense crowding that CB suffers won't be a big factor in making things worse. Also we have the advantage that we out-

number the newcomers and will for some years to come. CB's problems started with an explosion of new operators who overwhelmed the few early users. There was no chance to introduce the newcomers to established operating practices. We have that chance, if we don't blow it. Things will change as the demographics and size of the operator pool changes. We have the opportunity to guide the changes that will inevitably come to amateur radio, if we are willing to get out and work to do so. Not all of the changes will be bad. We will either learn new ways ourselves, or be relegated to the old fossil's corner. Times of change are times of opportunity if you have an open mind. Only dead things don't change.

As a positive example of what you can do. In your licensing classes, spend the time you would have taken teaching Morse to prospective Techs, teaching good operating practice. On the air, welcome the newcomers and demonstrate by example good operating practice. At your club meetings, seek out newcomers and welcome them. Invite newcomers to participate in your activities.

To handle the inevitable troublemakers found in any new barrel of apples, dust off that DF equipment. Organize a group of turkey hunters. Bring social pressure to bear against the bad guys. As a last resort, work through the ARRL monitoring system to aid the FCC in shutting them down. Become a part of the ARRL monitoring system yourself, make it work.

We have the power to make amateur radio better than it is, if we are willing to work at it. Sitting on the sidelines gripping and whining won't do the job.

I don't agree with this one at all, at least as applied to myself. I have no problems with more technical people in ham radio; my apprehension about the no-code license is that we will be inundated by the antithesis of those - the unruly CB-outlaw types.

>It just dawned on you now? I've been picking up those vibes since the

I _do_ have a problem with this, though: there should _always_ be a place in ham radio for people who can contribute in non-technical ways.

This group is _extremely_ atypical of the general amateur population. Usenetters are, by and large, technical people. That's _not_ true of the amateur population as a whole. There are many folks who contribute to the fulfillment of the basis and purpose of the amateur radio service without ever picking up a soldering iron or firing up a compiler. The posters to rec.ham-radio.* keep forgetting that.

Just to foreign nationals, the way I understand it. My father's father,
although of Italian decent, held Canadian citizenship during WWII. Upon
being faced with giving up his SWR, he decided to bring it to my mother's
mother's house. This way he abided by the law, but presumably was able
to listen to his radio when he wanted.

I agree...that's why Paul proposed it and I adopted it.

>I don't know about replacing `ham' with `amateur'. I think most people would
>call themselves `hams' and not `amateurs'. Besides, `ham' is easier to type.
>Basically, it doesn't seem to me like there's a good enough reason to change
>it from what it was. But i don't think it makes a big difference either way.

Who types newsgroup names?

"Amateur" is the official name of the service, and is internationally
recognized. "Ham" is an American colloquialism. Which is better suited to
an international network?

>I think that it'd be useful to have a separate `tech' group. Questions like
>``What sort of cut-off slope can i get with so-and-so filter?'' don't really
>belong in a general group. Regarding flames, the `legal' group is supposed to

>another group. And regarding gatewaying, i don't see why both groups couldn't
>be gatewayed together. The mailing list members need never know there are two
>separate groups.

The problem there comes when mailing list readers reply to messages in the
group. Naturally, they reply to the mailing list. Where should the list post
those replies? Posting to just one of the groups breaks discussion chains,
while posting to both will result to non-technical postings to the technical
group and technical postings to the general group - which defeats the purpose
of splitting the technical postings out in the first place.

[about naming the general discussion group .misc]
>I think this encourages people to classify their discussion into the right
>group, rather than just dumping it all in a parent group. There's already at
>least three subgroups, and most likely more will be added in the future. So

I have a Roland printer which is the same as your Panasonic.
Roland advertises the memory upgrade as a 'chip' and I have talked
to a service tech. who said that it is just a memory IC.
I took a look at my printer trying figure out how to open the case
and couldn't see how. I decided before I tried being too forceful
I'd wait for the warantee to expire :-). If you figure out
to open the case please let me know the details.

BTW I've had this printer almost a year (guess that warantee must be
almost done :-) and have found it to be very good.

Hey, I build, and experiment! I have only ONE piece of HAM gear that is 'stock', my HTX-100. Everything else is modified, or has homebrew attachments. A hombrew/kit based 10M-2M-SSB transverter. A Radio Shack TRC-457 converted to 1MHz wide on 10M (well, almost!). Scan mods in my Kenwood TR-2400. Homebuilt base charger, and home design 10W amp for my 3AT. I could go on, but when I commute in the car, all you hear is my 'yak' on 2M.

But you're right, there are appliance operators, and they make 2M just a marginal step from a party line phone. But those that I know like that are extras. But to be fair, they are experimentors on HF. One guy I THOUGHT was pretty sharp, and I still think he has immense practical knowledge on HF, thinks disabeling the PLL lock feature will 'fix' his PLL problem on his 2M setup. He's sure it's just to keep him from going out of band. Well, the guy may be totally wrong, but at least he went into the schematic and looked, although he doesn't understand PLL at all.

> CW operators, then the license structure should encourage CW training.
>
>
> Kip

As a former naval officer on submarines (out in '83), I can only speak a little about that area. ..... certain foreign countries of interest use manually sent CW for their standard fleet communications. Intelligence specialists, gathering info on these guys, needed the ability to copy CW as if they were the other side's fleet operators (coded groups in a non-English language). It was also painfully obvious that the operator's shifts had changed when the 'fist' changed.....

Our own comms, of course, were not manual CW. However, CW came in handy :

a. For UQC (underwater telephone) when voice reverb or s/n was too poor. The manual CW button on the box was good for the occasional 'R' or 'C'. (But the other station needed to know morse too. Send slow so they can read the table off the side of the box!)

b. Close aboard surface ship maneuvering uses flashing light CW for passing messages. Having the ability to read audio CW at 5 wpm transfers to reading light sigs to standard speed also. (You'd also be surprised at all the lights from docked vessels flashing out to the departing ship. And how many of them are just personal conversations between the signalmen :-)

I understand that the POWs in N. VN communicated in morse. Part of pilot training in the '50's was a Morse class. (My father did this)

Most of the civil aircraft navigational aids identify themselves in CW, though that's changing because reading the dots and dashes off the charts was too unreliable.....

But as a reason for keeping CW a requirement? I don't think it'll fly anymore. We don't have mandatory ROTC either.

Actually a low pass filter, for instance, becomes a lower and lower impedance as the frequency approaches resonance, at which time it becomes a "short" to ground. The energy is dissipated in the output resistance of the driving device. There will be "reflection" only is there is a "long" transmission line between thefilter and the driver and the input impedance of the filter is substantially
different than the transmission line. K9ALD

Why do you assume that the amateur service, by changing the makeup of its testing process, will become like a service which has no testing at all? This is not a logical assumption.

I think what we have here is a case where some amateurs of limited knowledge of communications technology assume that if ham radio changes it can only change into the only other form of two-way radio they have personal experience with - CB. Well, I have news for them - there is far more to radio communications than ham radio and CB.

Since there is still theory, rules and practices testing, the no-code amateurs are more likely to be from the non-CB area. In this case, I think ham radio will benefit from their expertise in other areas. Indeed, we "old timers" may be put to the test to keep up.

There is a sad element here. The bitter oposition to no-code in some circles is likely due to the fact that code is the only thing singular and out of the ordinary that they can do. By dropping the code requirement, we take away the only thing they have to make themselves feel good about themselves. Such people, I fear, would rather see the no-code tech license fail and destroy ham radio than to lose their delusions of specialness.

Lieutenants are rather well removed from the policy making end of the chain of command in the Navy. Particularly the USNR (as opposed to USN) types. [:-)

Actually, recruiters will promise anything to anyone who is at 98.6 degrees Fahrenheit and can bend over during the physical without falling flat on his face. As often as not, the service after receiving the recruits' complaints about not getting what they were promised, shrug it off.

>demonstrate a barely literate ability of CW? And that is about it.

Unfortunately this is not true. If you don't operate CW, build CW rigs, talk to DX OPs that run CW you can't know what is going on out there. You don't know what you are missing because you don't speak the language. The percentage of activity that envolves CW is much greater than 2%. Ask anyone who runs all modes..digital, phone, SSTV, CW etc. what the true volume of activity is. you might be surprised.

As to this "elitist" charge, I know many many CW OPs and I have never met one who did not do his best to encourage other hams, both new and old, to take up the practice. You will find CW OPs to be friendly, patient, and enthusiastic about bringing others into the fold.The only people I know who think CW OP's are elitist are those who don't work CW. How can they know whats going on if they don't speak the language. When you get tired of the nasty hamming you will find on the phone bands, talk to some CW OPs and you may find that the ham radio that you really wanted to engage in does exist.

And I don't see much of a need for ARRL OO's to be more hyper about enforcement than the FCC is. I am sure that the FCC's decision not to have distinctive callsigns was deliberate, considering it would have been so easy to do.

>>that 50-50.1 and 144-144.1 is CW ONLY (which they are! I didnt realize that
>>until I looked in the rules...hmmph..guess you do learn something everyday..
>>CW at 6 and 2??? Guess the Gonsets have a strong lobby!)
>>73
>>WB5ITT
>
^Remember^!! part 97 is USA FCC rules; they do not apply to us in Europe. We
have our own rules. Vive la Difference! I looked in my copy of ITU Radio regs,
and there was no mention of 'CW Only' or 'Phone only' subbands to be seen....
I then looked at my licence; no restriction on modes/frequencies there
either (except on Pulse-modes which are verboten anywhere below 1GHz).
As I said before, 'CW only', 'Phone only', 'Data only' restrictions do not
apply to most of the World. The FCC has *no* jurisdiction outside the USA..

Thats the nice thing about 'Rules'; if you dont like one set, you can always
find another set!

>Could someone post to net or email to me the 10 codes used on police radio
>frequencies? Thanks.

10-codes vary a great deal from department to department, so you need to know who you are listening to. For instance, 10-4 is:

'Acknowledgement' to APCO (? I don't know what it stands for)
'Auto Accident (P.I.)' to Richland County sheriff & Mansfield police
'Auto Accident (P.D.)' to Columbus, OH, police

Also, many PDs and sheriffs don't use 10-codes, but just numerical codes. There is a BSSA (Buckeye State Sheriffs Assoc) standard list widely, but not universally, used in Ohio. The state highway patrol and the state department of natural resources (park rangers) have a different list. Many ambulance, fire, and EMS companies have their own codes.

My reference is "Scanner Radio Listings: Columbus & Southeastern Ohio". I recommend you get something similar for your region. I got mine from Universal Shortwave Radio, or try: Mr. Scanner\ 1107 Sharewood Ct.\ Kettering, OH 45429. Or check a local ham or SWL dealer.

Message-ID: <1250314@hpnmdla.HP.COM>
Source record: 5111

In rec.ham-radio, tad@ssc.UUCP (Tad Cook) writes:

>But my point is how can it be illegal to have a reverse autopatch (just
>because a non-ham might ring the phone causing the repeater to transmit)
>if it is LEGAL to have a possibly non-ham burglar cause the repeater to
>transmit when he sets off the burglar alarm?

I'm not sure the burglar alarm IS legal, but the justification for it is
that this is an emergency (immediate danger to life/property) situation.
Clearly the reverse autopatch for non-hams is illegal, despite the
fact that some repeater groups have it.

SB RTTYDX @ ALLBBS $RTDX1214
RTTY DX Notes 1of3 12/14/90

RTTY DX Notes for week ending 14th December 1990
BID: $RTDX1214
Part 1 of 3.

Due to the amount of interest in the DX Notes, there will be no break
over the Christmas period. There will be a change in editor from
January 25th for a period of three weeks until February 12th while DX1
has a small trip away. The notes will be edited by I5FLN for that
period with the assistance of OD5NG, so for those three weeks, please
send your DX information to I5FLN via VK2AGE, TG9VT, OD5NG, or any
other path that will get them to Luciano in time for the next week's
news.

In the mean time, thank you all for your help and interest over the
past years. We hope to continue in the same vein in the forthcoming
years.

And now for the bad news. The bands have been lousy, terrible and at
times nonexistent for the past week.

Our thanks this week go to: I5FLN, OD5NG, TG9VT, VK2EG, W2JGR and the
Tristate VHF DX Packet Cluster Network, as well as several other
packet clusters. Thank you for your assistance with the information.

SB RTTYDX @ ALLBBS $RTDX1214B
RTTY DX Notes 3of3 12/14/90

RTTY DX Notes for week ending 14th December 1990
BID: $RTDX1214B
Part 3 of 3.

VU2SJV nominates N2HOS as his QSL manager.

VE8RCS requests their cards via the Callbook address. Also see notes.

Notes of Interest:

Please note that cards for the HK0TU operation should go to HK3DDD only. Do not send them to the operator or anyone else.

Kure Island (KH7) should show up at any time and will be there until 21 December, but so far no reports.

PA3DUU will operate from Morokulien (on the Swedish/Finnish border) with the call of LG5LG December 22 to 29th, QSL to LA5DFA. at the moment it has no DXCC status.

3W3RR is still on track for Afghanistan late December, donations to NT2X. The Spratly operation has been delayed until next year.

HA9RE and HA8XX will be touring the South Pacific for the next 6 or 8 weeks. They will include Chatham Island, Rarotonga and Niue Island in their itinerary. QSL to DJ1ND.

VE8RCS, Polar Amateur Radio Club, are presently operating from Ellesmere Island, about 40km from the North Pole.

5B4XA reports that he suffered no damage from the recent earthquake.

But if you are missing some of your 'G' friends, they are possibly
sitting in their fridges keeping warm.

This is taking another turn...

No one will argue that if you don't know CW, you don't know what you are missing. CW is it's own language, and the people IN CW usually are very courteous and friendly. The unfriendly people are usually (IMHO) the people OUTSIDE CW, but who learned it and AREN'T using it. I'm not saying that if you learn CW your a jerk if you use phone.

Where and when people become imature and assine is beside the point.
Whether people enjoy CW or not is beside the point.
The point is should people be FORCED to become CW proficient!

There is a big difference here in the arguments. Here is a small aspect of HAM radio that is forced on people, regardless of their desires and wants. I think CW would be more successful if it was offered as INCENTIVE, not as a requirement, or 'paying dues' to join the club.

SB RTTY @ ALLBBS $IRDX1290
IRDXA 12/90 Bulletin

BID: $IRDX1290

IRDXA Project Status Report 12/90

The International RTTY DX Assoc (IRDXA) provides RTTY equipment to
DXpeditions and resident amateurs willing to provide contacts from
rare DXCC countries.

Thailand - RTTY is still not authorized. IRDXA PK-232 will be active
at HS1AC (Science Museum) when RTTY is legal.

Tristan de Cunha - ANDY, ZD9BV and his bride ZD9CO are both active.
Listen to his Wed/Sun sked with W4FRU on 28466 at 1700.

Rodriguez - 3B9FR made a few contacts in late Nov. His IRDXA RTTY gear
but has been very scarce on any mode. Please encourage him.

Papau New Guinea - P29BT was QRV for a few weeks with his IRDXA gear
very low power after blowing his transmitter. He will be in the U.S.
for a month. He hopes to return to P2 in January with a new TS-440.

Malpelo - HK0TU (Raul) and the Malpelo crew did a spectacular job.
Best run expedition and pileups in several years.

Malawi - IRDXA sending equipment to 7Q7LA in early December. Thanks
to all who send donations. This potential new one negotiated by
W8SEY.

Juan Fernandez - CE0ZZZ another well run DXpedtion. Congrads guys.
Bangladesh - Vince Thompson K5VT plans to return as S2VT in late
February with IRDXA RTTY gear. X ur fingers.

Spratley - Romeo, 3W3RR is making a return trip. IRDXA is trying to
get new RTTY gear into his hands for the trip.

Thanks to all who came to the rescue of IRDXA in our time of need.
We are now solvent (at least for the moment) and shipments are going
out. Please don't hesitate to help if you enjoy working the new ones.

IRDXA, 356 Hillcrest St, El Segundo, CA 90245 USA.
Phone (213) 322-7112 or fax 213-322-7114.

This is not necessary, as programs such as SuperMorse have user adjustable timing parameters. I used SuperMorse 3.15 to prepare for my Novice exam last summer, and found it extremely friendly and helpful. I've seen it run on 8088, 80286, and 80386 without any problems (clock speeds ranged from 4.77 to 25 MHz). I don't have the info handy on where to get it (it's shareware and I got it from a BBS), but if you want it and can't find it anywhere, send me email and I'll try to work something out.

In rec.ham-radio, kipper@ccwf.cc.utexas.edu (Kip Ingram) writes:

>Hi. A quick question about Chebychev low pass filters. The ARRL Handbook
>says that the passband SWR depends on the passband ripple (bigger ripple,
>bigger SWR). My intuition tells me that that would only become a problem
>if you actually used the filter all over the passband; SOMEWHERE in the
>passband the high SWR would occur. If I'm running at a single, crystal
>defined frequency, can't I tune my antenna for good SWR regardless of my
>filter?

If you have a narrowband signal, a Chebyshev filter is the wrong thing to
use. Align all the poles (tuned circuits) up to the same frequency for
a single-peaked response. You get a lot better attenuation of the
undesired signal this way.

>Also, a more theoretical question on filters. A low pass filter prevents
>high frequency energy from reaching the load. However, the filter is
>comprised only of inductors and capacitors, so it can't dissipate that
>energy. Furthermore, the filter components can't store it either, since
>that would result in a long term uptrend in stored energy which would

>left for the energy to go is back to the source. So apparently a filter
>really functions as a reflector in its stopband, sending energy back to
>the source rather than allowing it to reach the load.

Correct. Although if there's a direct connection between source and
filter (no transmission line), it is more useful just to think of the
filter as a reactive load (inductive or capacitive) in the stop band.

>Of course, this means that the source must absorb all of the stopband
>energy. I'm building a QRP transmitter that filters a square wave to

>power amp stage to get more power later, I think this means I should
>amplify the sine wave rather than the square wave. Because if I
>amplify the square wave and then filter it, the amplifier output stage will
>have to absorb the now amplified harmonic energy. Right?

If you feed the square wave directly into the amplifier, you will
essentially have a "class D" amp. This is more efficient than a class
C amplifier, but has higher output harmonics. In theory, a class D
amplifier is 100% efficient. When the output stage is "ON" (zero ohms),
there is no voltage across it, and thus no power dissipation (P=EI).
When the output stage is "OFF", there is no current through it, so again
P=EI=0. In reality, of course, the "ON" resistance is never zero,
and the switching time is never instantaneous, so the efficiency is
not 100%. I believe actual efficiency is a strong function of the

topology of the output filter network.

Because the burglar didn't set it off - he doesn't even know it's there. The
control operator set it off when he established the conditions which would
produce telemetry to notify him about perturbations in the repeater environment.

Actually, the disconnect packet did not have to be ACKed by the ground station. (Gary has verified this.)

But the QSO-number packet did have to be ACKed, which presumably kept a lot of people out of the log. :-(

4511. Omenmeters and Joltmeters (was Re: A New Problem)

Newsgroup: rec.ham-radio
Date: 1990-12-20 20:23:52 UTC
From: olson@bootsie.UUCP
Message-ID: <46@bootsie.UUCP>
Source record: 5121

In article <7500071@hpfcso.HP.COM> ron@hpfcso.HP.COM (Ron Miller [NW0U]) writes:
...
>After all, the gang that doesn't know an "omenmeter" from a "joltmeter,"
>and are known to carry saltwater in jugs in their car trunks to
>improve their signals, aren't going to pass the test. :-)

I'd have to assume that an omenmeter measures Omens, which must be
the reciprocal of Nemos, the unit of salt water signal strength
improvement. 1 Nemo is equal to 12 gallons 3x10^3 ppm NaCl H2O
per trunkmount meter watt. This makes Omens a terribly inconvenient
unit to use, although, due to physical constraints, it is much
easier to build an Omenmeter than a Nemometer.

Joltmeters measure caffein.

:-) :-) :-) :-) :-) (and, for those who know more "CW" than "usenet",
HI HI HI HI HI).

In <davet@tsdiag.ccur.com (Dave Tiller N2KAU)> Dave says:

]In article 28281 of rec.ham-radio Dube writes:
]
]>It is not illegal to MODIFY equipment.
]See below.
]>It is not illegal to BUILD equipment.
]For just about any other service, yes it is.
]>It is not illegal to OWN a receiver.
]For cellular phone without a service contract? Yes it is!
]For 10.525/24 GHz in Ct, Va, and Dc, yes it is!
]>It is not illegal to OWN a transmitter.
]>It is not illegal to TEAR UP equipment (presuming it's yours).
]>
]>It doesn't take a lawyer to figure this out; all it takes is the ability to read
]>and apply common sense.

]Perhaps you should apply a bit of your own wisdom to yourself.

OK, I'll try.

]Regarding the CB service and modifying radios:
]
]Title 47, Part 95
]
]95.425 (CB Rule 25) May I make any changes to my CB station transmitter?
]
](a) You must not make or have any one else make any internal modification
] to your CB transmitter.

If the "you" in this rule happens to be me, I can do this if I am a person
certified as technically qualified as stated in 95.424 (b) below. However,
I agree that this is beside the point.

Applied common sense:
Once modifications have been made, the type-acceptance has been voided and
the transmitter is no longer a CB transmitter. You can no longer use it in
CB service (nor any other service that requires type-acceptance); but you
may use it in the Amateur service since that service does not require type-
accepted equipment.

]further:
]
]95.424 (CB rule 24) How do I have my CB station transmitter serviced?
]
](b) ... internal repairs or internal adjustments should be performed by

] or under the immediate supervision and responsibility of a person
] certified as technically qualified to perform transmitter maintenance
] and repair duties in the private land mobile services and fixed services
] by an organization or committee representative of users in those services.
]
I might meet these requirements, but this does not mean that I can modify any
type-accepted equipment to operate outside the conditions of its type-
acceptance. On the other hand, I might modify it anyway, and I could lose my
license by so doing.
]
]For the Private land mobile radio services:
]
]90.427 Precautions against unauthorized operation.
]
](b) ... no person shall program into a transmitter frequencies for which
the licensee using the transmitter is not authorized.

Applied common sense tells me that this is tantamount to modifying type-
accepted equipment (see my point above).

]For the Aviation services:
]
]87.73 Transmitter adjustments and tests.
] A general radiotelephone operator must directly supervise and be
] responsible for all transmitter adjustments or tests during install-
] ation, servicing, or maintenance of a radio station. A general radio-
] telephone operator must be responsible for the proper functioning of the
] station equipment.

ibid.

]I have read parts 0-19 and 80-97 exhaustively. I don't claim to remember
]everything I've read, but I sure remember that your above generalizations
]are not always true. The above references were gleaned from the regs by
]quickly glancing at the indexes of the individual parts. Please read the
]regs for other services before you arrogantly generalize and patronize other
]readers of rec.ham-radio.

Well, I happen to think they are true; otherwise there are lots of Hams who are
in real deep crap by operating equipment taken from type-acceptance services
and placed into operation in the Amateur services.

I don't believe in gunbarrel vision when it comes to regulations. One needs to
think about the intent of the regulations.

73,
Dube N5PDK

4513. SAREX QRZ list as of 12/16/90

Newsgroup: rec.ham-radio
Date: 1990-12-20 20:36:16 UTC
From: winter@Apple.COM
Message-ID: <47526@apple.Apple.COM>
Source record: 5123

I received this note from Tom Clark of the SAREX project the other day. It lists the callsigns that have been verified so far as having been heard by the SAREX packet robot. As he mentions, the list of stations actually worked by the robot will be released later.

Subject: SAREX "QRZ" Lists

Only a few of the SAREX "QRZ" Heard logs as monitored around the world have been received here so far. Folks are reminded that we really do need the data from the QRZ beacon. The plea for this data went out before each of the earlier abortive launch attempts. Unfortunately I had to be away at a professional meeting during the flight and it seemed that none of the SAREX news reiterated the request.

What we need is the text of the "QRZ" beacon, complete with the beacon serial number and some sort of indication of the date/time (UTC preferred). Such information can be sent on packet to

SAREX@W3IWI.MD.USA

or via internet smtp mail to

sarex@tomcat.gsfc.nasa.gov

So far about a dozen people have sent in logs covering only 20 of the 1300+ "QRZ" beacons and with big time gaps in the coverage. This means that we have a total of about 700 lines of log with 376 unique calls in the list as having had at least one packet frame heard by the shuttle. About 30 countries are included in the list. A couple of bogey calls (like TEST and KJ9) as well as some folks' typos (note both WQzeroP and WQohP) are seen.

If you aren't in the list that follows it means one of two things:
1. The shuttle did not hear you
2. Nobody has submitted a "QRZ" beacon for the time you were active

There is the hope that Ron captured some of the QRZ beacon data to the disk on the Grid laptop during the flight but I haven't seen those logs yet. There was not enough memory in the SAREX TNC to save all the calls heard, so the list of the 35 most recently heard calls in the QRZ beacon may be the only record of your having been heard! It really is important to have the QRZ beacon data sent in ASAP.

The "QSL" worked list was saved in both the TNC's RAM and in the Grid, so the complete list of stations with completed QSOs will be distributed as soon as we analyze the flight logs.

ARRL AMATEUR RADIO NEWS RELEASE #30
PART 1 OF 2
BID: ARNR001 DEC. 13, 1990

FCC CREATES CODELESS CLASS OF AMATEUR RADIO LICENSE
For the first time ever, starting in February it will be
possible to obtain an Amateur Radio license in the United States
without passing a Morse code test. The Federal Communications
Commission (FCC) has eliminated the need for new Technician class
Amateur Radio license applicants to demonstrate proficiency in
Morse code in order to have all amateur privileges above 30 MHz,
The implementation date may be as early as February 1991.
Technicians who obtain their licenses prior to that date will be
grandfathered, meaning their existing HF privileges will continue.

The codeless Technician written examination will have 55 questions.
New Technicians wishing to gain access to the HF privileges below 30
MHz now enjoyed by Novices and Technicians will be required to pass a
5 WPM Morse code test before three Volinteer Examiners accredited by
Volunteer Examiner Coordinators, and will be given a Certificate of
Successful Completion of Examination (CSCE) to serve as evidence of
their qualifications. There will be no call sign designator to
indicate Technicians who have or have not passed a code test.

The FCC took this action in response to numerous petitions
and public comments. By offering a codeless class of license
with privileges exclusively abova 30 MHz, an entry level license
will become available to those who find the Morse code a barrier
to becoming an amateur radio licensee. The FCC decided to retain
the current Novice Class operator license as an alternate entry
level license for those persons able to pass the 5 WPM Morse code
test instead of the more comprehensive written exam required for
the Technician Class license. No changes in Novice examinations
or privileges were announced.

At a press briefing held just after the Commission's meeting, FCC Private Radio Bureau Chief Ralph Hallar said, "The Amateur Service is not growing as it should relative to what it has to offer." He said that the Amateur Service is where our nation's technical expertise comes from--that the changes should attract people who are interested in computers and digital communications, and should help the U.S. to be more competitive.

February 1991 QST will carry more details.

ARRL AMATEUR RADIO NEWS RELEASE #30
PART 2 OF 2
BID: ARNR002
DEC. 14, 1990

ARRL APPLAUDS FCC RETENTION OF NOVICE LICENSE, SEEKS INPUT ON
PRIVILEGES FOR CODELESS TECHNICIANS

Responding to the Federal Communications Commission action in PR
Docket 90-55 creating a codeless class of Amateur Radio license, the
President of the American Radio Relay League, Larry Price, W4RA,
noted with pleasure that the Commission had decided to retain the
Novice license as a means of entry into Amateur Radio and to adopt a
codeless license with a meaningful written examination requirement.
Our members were very strong on both of these points, because they
Couldn't imagine how we could maintain the character of the Amateur
Radio Service without them." Mr. Price said.

However, President Price sounded a note of caution with regard to the
privileges the Commission plans to grant to Codeless licensees, "The
formula developed by the ARRL Board, which called for privileges above
220 MHz, was based on extensive membership input. It was carefully
balanced to offer attractive privileges while protecting existing
patterns of amateur activity." While it will take sometime to gauge
the reaction to the Commission's action. Mr. Price observed that the
FCC formula is likely to be less acceptable to many amateurs than the
League's. He asked that League members share their views with their
elected Directors, who collectively determine League policy.

"Before we can decide whether to request that the Commission partially
reconsider its action, we'll have to see the Report and Order," said
Mr. Price. Usually it takes the FCC from several days to several weeks
after a Commission action to release an item after editorial review.
There is a 30-day window of opportunity following release in which
petitions for reconsideration can be filed. Mr. Price noted that the
ARRL Board was holding its regular meeting on January 18-19, 1991.
"The timing looks good for a careful review of the Commission's

action at that meetlng." he said.

>1st phones were up for renewal.
>

Since I have a General Radiotelephone study guide (as published by Sams)
on my bookshelf, I suspect that they did test for the General at one time or
another (if they do know, I don't know. Brian Kantor probably knows (and
may even still read this group) and could possibly tell us).

Of course, it could just be all my overheated imagination...

In recent article cy5@cunixa.cc.columbia.edu (Conway Yee [N2JWQ]) writes:
>I must disagree. IMHO, much of the opposition is due to the "because I
>went through this shit, you must go through this shit" syndrome. This
>phenomena is most clearly observed in the treatment of medical interns/
>residents but can be discerned here also.

This is also the justification for fraternity hazing, parental
discipline tactics, etc. It's basically saying "its that way because
its always been that way." It's a common societal tendancy.

Personally, after seeing that the no-code license is going to be available,
I decided I should go ahead and do it (if only to get some use out of
all the radio gear I seem to be accumulating :-). But after looking
at about 5 books on Amateur Radio (including the ARRL Handbook and,
my personal favorite so far, "How to be a Ham", by W. Edmund Hood W2FEZ), I've
decided that most of the aspects of Ham Radio that I find "charming" (like
climbing trees to put up huge dipoles, buying an archaic tranceiver at
a flea market for $25 and getting it running, and DXing) are related to <30MHz
operation. On the other hand, the aspects of Ham Radio that I find most
"powerful" (like Packet Radio and ATV [fast-scan]) are available to the
new codeless tech.

I mean, if I point at my HT and say to my friend, "Look at my Amateur Packet
Radio Station!", I think I'll get chuckled at a bit. It doesn't look
very impressive. On the other hand, I could always use the description
I used for the original (classic) Macintosh: it only looks small when it's
off!

Anyway, I've pretty much decided that 5WPM is trivial, and once I've
got equipment tempting me to operate <30MHz I'll probably _upgrade_
to Novice (so to speak). I will probably never operate CW without the
aid of a computer to en/decode; it just doesn't interest me. (OK,
maybe occasionally trying to understand random morse I hear somewhere...
but it's not something I would try to get _good_ at!)

Please note: Code/NoCode is a heated issue. Please don't flame me,
and if you must, please do it on email.

Cheers!

-Eric

P.S. Is the salutation '73' from the median impedance of a dipole?

{|
{| FIGHT LIKE HELL TO KEEP THE 30 METER BAND AND DIE IF NECESSARY TO KEEP IT CW
{| ONLY.
{|
{| A message to the more virulent no-coders out there:
{|
{| IF WE GIVE YOU ALL OF THE REST OF THE SPECTRUM FOR NOTHING...WILL YOU LEAVE US
{| ALONE ON 30 METERS?
{+---------------
{
{Gee, I thought I had an amateur radio license. I guess I accidentally got a
{CW radio license. I'd better write to the FCC and see if amateur radio still
{exists or not. :-(

Last time I looked at the regulations, CW was legal on ALL amateur
frequencies, and only has a few EXCLUSIVE CW freqs.

As a one time Canadian, I would point out that Canadian phone bands have
ALWAYS coexisted with US CW!

CW is even legal through repeaters even if there IS a speed limit :-)
(Got to check on that one BTW)

I always find it interesting that it is the long-term Technicians that propose the two level or classes license structure. I wonder want the real motivation is to propose the present Techs should be grandfathered to full HF priviledges. I feel it more they want the full HF priviledges and don't want to learn the code. Actually there is more to learning the code on upgrading. It also is learning the answers to more theroy questions. Otherwise there would be few if any General class license holders.

Most countries that have fewer classes than the US still have some minimal requirement for minimal priviledges, and a full priviledge class for a more difficult exam along with a no-code license. This is a more reasonable proposal.

What are the implications of charging at less than the rated current?
I've been charging a 10V 450 mAh at 40ma overnight. The pack says to
charge at 45 mA for 14 hrs. The pack never seems to get above 9.6 V
(on the other hand, the radio receives fine. I haven't transmitted because
it's an as-yet unmodified commercially licensed radio, and I don't have
a license yet even if it _were_ modified!). The charger is just a 12VDC
supply an a resistor (and a block of wood and two screws!).

Thanks!

-Eric

(some deleted)
]
]
]Probably the biggest incentive for my posting was the bold printed, red
]warning sign that came with my Uniden 2510 10meter rig. They threatened
]that if I ever modified my rig (added the jumper that enables CB) and returned
]it for repair, not only would they not repair the radio but they would also
]notify the FCC.
]
]This bothers me. It's assumed that since I can use the radio on CB, I'm using
]the radio as a transmitter and have done something wrong.

It bothers me too. I can understand their not wanting to work on the radio,
but I can't understand their threat to notify the FCC. And even so, what if
they did?

It is very likely that they feel that they are being put under the gun if they
send the radio to you with this mod. I wouldn't be surprised to find that they
have had to certify in some way that they will not ship radios that are capable
of operating in the CB band without being type-accepted for that service. This
being the case, they could get in trouble by sending it back to you, even
though they *did not* do the mod themselves. After all, how could they prove

it was you, and not they, who did it.

Some people (and probably you) can do such neat work that it might look like it came from the factory that way! Might it not be that their "notification to the FCC" would take the form of letting them know that they received it that way, so as not to take the chance of losing their rights to sell the radio in the US? Might it not just be a case of CYA, rather than a threat to "tell on you?"

Just musing....

73,
Dube N5PDK

I'm confused. Forgive me if this is a dumb question.

The question list I have has elements 2A,B,C,D,E,F,G,H,I;
3A,B,C,D,E,F,G,H,I; etc. I see references to Novice being
element 2, and the codeless tech being 3A, or 3A and 3B.

What about 3C thru 3I?
My book lists these as pertaining to Wave Propagation, Amateur
Radio Practice, Circuit Components, Practical Ciruits, and Signals
and Emissions.

Am I looking at a really old list? The book's from 1986.
("How to be a Ham", W. Edmund Hood, W2FEZ, Tab Books).

Some of this material is covered in a cursory manner
in element 2 (and I presume that the Novice exam consists
of all the subelements A-I of element 2). Does the tech. exam
really only require more knowledge of Rules (3A) and Operating
Procedures (3B), no additional theory?

If so, I've been studying _way_ too much. :-)

P.S. My father has study guides and stuff from the 40s and
50s-- things have changed a lot! (He never became a Ham, but
is considering it now...)

Thanks! (and sorry if this is too stupid)

-Eric

REASON FOR POSTING HERE

For all readers that like to DX FM, for all that like to listen to that distant or weak non-commercial FM station, or listen to that commercial station with the rare format, this information is for you.

I have just found what I believe is the best FM antenna in the world! I am not at all associated with this manufacturer, or distributor and will not profit in any way from any effect on sales that this posting may cause. My motivation is that I have sought long and hard for an antenna like this and never found one. In fact, write-ups in various club publications mention the best FM antennas and never mention this one; I think few people know of it, and am soliciting opinions of readers with any experience with it. I do not own one yet, and would like to hear from someone who does.

PHYSICAL DESCRIPTION OF ANTENNA

Imagine the loop antenna found on the back of most television sets for UHF reception. Then imagine that a loop antenna is used for FM [in North America, 88-108 MHz] reception. The FM loop is much bigger due to wavelength, with the diameter of a standard FM dipole antenna. This loop adds in front to back ratio since signal from one direction of a circularly polarized station will be increased [horizontal plus vertical] while in signal from the other will be decreased [horizontal plus vertical, but 180 degrees out of phase]. This loop is the antenna feed.

In front of the loop are a long series of directors, similar to a standard fringe area VHF or FM antenna. The difference here is that they are not on a single plane as in most fringe or yagi antennas, they are on three planes: one is at the center of the loop, one at the top of the loop, and one at the bottom of the loop.

Behind the loop are reflectors, but these too are not in a single plane. In fact, they are similar to UHF corner reflector antennas, but with much larger physical dimensions.

In short, a side view of the antenna looks like this where 'x' signifies an antenna element perpendicular to the page [display?].

PERFORMANCE SPECIFICATIONS

Model Galaxie "23"
Gain [in decibels] 19.2
Front to Back Ration [in decibels] 38.6
Acceptance Angle [in Degrees] 15.0
Windload [in Lbs at 100 mph] 72
Length [in inches] 134.
Height [in inches] 33
Center frequency [in MHz] 93.

[Note that a 102. center frequency is also available with just slightly different specifications.]

AVAILABLE FROM

R. Smith Aerials
98 Ash Road
Luton, Beds.
England
Phone: LUTON 36561
Approx price in UK pounds [inc. 15% VAT] is 120. pounds for the 93 MHz model and 130 pounds for the 102 MHz model.

NORTH AMERICAN DISTRIBUTOR

Naim Audio North America Inc.
1748 North Sedgewick Street
Chicago, IL 60614
USA
Phone: 312-944-0217

Approx US price in USD: 450. [Note is might be cheaper to import directly; postage will be steep, but a 15% VAT discount will help reduce the 130 pound price. Naim's price is probably for the 102 MHz version, rather than the 93 MHz version.]

4526. Re: Chebychev Filters

Newsgroup: rec.ham-radio
Date: 1990-12-20 22:24:08 UTC
From: waters@darla.tmc.edu
Message-ID: <408@nddsun1.sps.mot.com>
Source record: 5136

In article <41662@ut-emx.uucp> kipper@ccwf.cc.utexas.edu (Kip Ingram) writes:

Gad! TWO technical questions in a SINGLE day! Must be the new no-code
license :-)

{Hi. A quick question about Chebychev low pass filters. The ARRL Handbook
{says that the passband SWR depends on the passband ripple (bigger ripple,
{bigger SWR). My intuition tells me that that would only become a problem
{if you actually used the filter all over the passband; SOMEWHERE in the
{passband the high SWR would occur. If I'm running at a single, crystal
{defined frequency, can't I tune my antenna for good SWR regardless of my
{filter?

You would probably get better results tuning your filter slightly, but in
principle you are correct. The nature of the so called "ripple" though is
to introduce a (hopefully) small reflected power even in the passband. This
is probably at a theoretical zero at certain discrete frequencies (no
modulation either!), but for ham radio that really isn't a concern.

Fixed frequency services such as broadcast and commercial fixed
communications though often use some very exotic tuning techniques to get
better efficiency/lower spurious radiation.

{Also, a more theoretical question on filters. A low pass filter prevents
{high frequency energy from reaching the load. However, the filter is
{comprised only of inductors and capacitors, so it can't dissipate that
{energy. Furthermore, the filter components can't store it either, since
{that would result in a long term uptrend in stored energy which would
{violate the assumption that everything is steady state. The only place
{left for the energy to go is back to the source. So apparently a filter
{really functions as a reflector in its stopband, sending energy back to
{the source rather than allowing it to reach the load.

Neglecting losses in the filter etc., that is true.

{Of course, this means that the source must absorb all of the stopband
{energy. I'm building a QRP transmitter that filters a square wave to
{get a suitably pure sine wave. That's no problem. But if I add a
{power amp stage to get more power later, I think this means I should
{amplify the sine wave rather than the square wave. Because if I
{amplify the square wave and then filter it, the amplifier output stage will
{have to absorb the now amplified harmonic energy. Right?

If you simply use a nonresonant low pass filter that is true. If you use
some form of resonance you can get a "flywheel" effect which is the
principle of class B, C and D RF amplifiers - the conducting element (dare
I say vacuum tube?) only conducts over a small portion of the RF cycle,

depending on the tuning of the output "tank" circuit to restore a good sine wave.

This is one reason why the broadbanded RF amplifiers are generally designed to be linear. (Meaning DC to 1Ghz BTW, as opposed to all of 2M).

In practice this is mostly a matter of how close you run things to burnout. Harmonics are just about always a lower amlitude than the fundamental, so absorbing them in the power amplifier simply increases its dissipation slightly.

{A Tech is a Tech is a Tech; welcome, all who will operate with common {sense and consideration of others!

No matter WHAT their class of license!

One question about the new no-code tech license: I thought I read somewhere that no-code techs would get 2x3 calls. Will a person with element 1A added still be able to get a 1x3 call? My wife is interested in getting her license, and I am wondering if I should try to speed up the process in order to get her an old-style tech license (and therefore a shorter call) before Feb. 15.

hmmmm attribution on that is confusing.
Accidentally i will assume. I made no
comment in my posting (line filler mode kicks in...)
about the "E" flags, though i recall them,
so it could easily have been the same
edition. The "E" was originally a US Navy
Award, much coveted to the most excellent
(or was it efficient) ship in fleet/squadron
or formation. It was prewar. During WWII
it was used with the vendors to symbolize the
same thing, excellnec above and beyond the
expected. Eventually, during the war, it
became the "joint army/navy E".

(My apologies, sort of, for the NET.BANDWIDTH
and particularly, the group.bandwidth usage.
BUT. I happen, in fact, to share Jim's views
on those who served in the military in WWII,
and at any time, and the values of patriotism.
I hold high respect for those who served, and
will not allow any misunderstanding on that.)

Somebody has misunderstood somebody.

It is legal to modify any kind of equipment for use in the ham bands,
and to build ham gear from scratch.

It is *not* legal to build CB equipment from scratch or to make CB
equipment by modifying equipment intended for other radio services.

In CB, you can only use equipment that is FCC type-approved for CB.

In article <7880390@hpfcdc.HP.COM>, perry@hpfcdc.HP.COM (Perry Scott) writes:
|> I must be missing something here, Paul. Maybe you need to explain the
|> difference between "(en)coding" vs "modulation".

I can explain this. Encoding is the representation of symbols (e.g., the letters of the Latin alphabet that we use to form words in the English language) in a different form that is more amenable to transmission over a (usually binary) communications channel. Encoding examples include ASCII, Baudot, EBCDIC and Morse Code.

The term "coding" can also apply to the reversible transformation of groups of bits for the purposes of improving on the raw error characteristics of the channel. In this case you have several distinct coding/decoding operations in series, e.g., the coding of keystrokes into ASCII and then the coding of ASCII-encoded characters into a forward-error-corrected code (Golay, Reed-Solomon, etc). (Some people also use "coding" to refer to the reversible transformation of groups of bits for the purposes of obscuring the meaning of the message to unauthorized interceptors, but this is more properly called "encryption").

Modulation is the process of varying the characteristics of a carrier signal to carry information over a channel. The carrier signal may be audio (e.g., on a telephone line), RF (for radio transmission) or light (for optical links). The carrier itself may or may not be sent as well.

Even in a CW station, the coding and modulation steps are distinct. If it's a manual station, the operator does the coding (and decoding) while the transmitter and receiver do the modulation and demodulation.

|> I always thought a CW
|> transmitter was either ON or OFF, which also sounds distinctly digital.

Yes, a CW transmitter is a digital modulator.

|> I also observe that most digital demodulators (which are usually FM in
|> one form or another) employ analog technniques (such as slope detectors)
|> in the early stage of the decoding process. Like I've said, I don't
|> understand your distinction between decoding and demodulation.

All modems are hybrid analog/digital devices; that's their function. Remember the origins of the term: MOdulator/DEModulator.

|> As for CW being an AM mode, that's a bit of a stretch. While CW takes
|> on two amplitudes there is no information in the amplitude itself.
|> Also, the sidebands are zero-width.

CW as hams know it *is* most definitely an AM mode. The modulating waveform is binary digital, slow speed and almost "square" (i.e., its rise and fall times are short with respect to the on/off durations). The modulation factor is 100%. *ALL* of the properties of more conventional AM systems are present in an on-off keyed CW system, including the production of sidebands. It is *impossible* to send information over a channel of zero bandwidth. Remember the Shannon formula:

C = B log2(1+ S/N)

where C is the channel capacity in bits/sec and B is the channel bandwidth in Hz. If B = 0, then C = 0, no matter how large the S/N ratio is.

If you look at it in the time domain, there certainly is information in the amplitude of a CW signal - there are two possible values, "on" and "off". If you look a typical CW signal in the frequency domain, you will see that, as with AM phone, quite a bit of transmitter power goes into the (informationless) carrier, and relatively little energy lies in the (information-bearing) sidebands.

Suppressed-carrier AM schemes such as BPSK (which is nothing more than suppressed carrier DSB-AM with a digital modulating signal) is much more efficient since all of the transmitter power goes into the sidebands. Unfortunately, I don't know of anyone who can copy BPSK signals by ear, although they are readily copyable with simple hardware.

Phil

>
I have no information on this recorder, but I do use a home brew
set up that gives me a similar result.

Use a -stereo- cassette deck and pump WWV in one channel and the other
audio channel can be used to record what you want (need). This does
require 2 radios, but that 2nd radio can be a cheap one since it only
sits on a time station.

This works not only for those times when your going away, but makes
reception reports a lot easier ;-)

Now if I could only find a cheap dual component cassette deck.....

4541. Program to analyze satellite footprints?

Newsgroup: rec.ham-radio
Date: 1990-12-21 03:19:07 UTC
From: dhp1@GTE.COM
Message-ID: <10278@bunny.GTE.COM>
Source record: 5151
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.space

I'm in search of a software package that will give satellite footprint information (i.e., maps) given information about the satellite antenna (e.g., boresight, pattern, gain, etc.) system. If the program can provide satellite ground tracks that would be a plus, though I already have something that will do that.

I'm not necessarily looking for something that will run on a PC....I can put software on most any platform (Sun, VAX, others) so I'm leaving that open right now.

The application is not ham radio per se, and yes, I am aware of the ham (i.e., AMSAT, etc.) satellite tracking programs.

Please e-mail any replies and I will post a summary if anyone shows interest in this.

4544. No-code: Cease Fire

Newsgroup: rec.ham-radio
Date: 1990-12-21 04:16:35 UTC
From: bobw@col.hp.com
Message-ID: <27080045@col.hp.com>
Source record: 5154

The FCC has acted and depending on who you believe, the bands will soon be overrun with undisciplined axe murderers or the average IQ of the radio amateur population will double overnight as the pent-up hoards of technical geniuses swarm into the amateur ranks.

Why don't we wait and see? In the mean time, let's see if we can't agree to a cease-fire here on the net.

Here are the proposed terms of the cease fire:

1. No-code proponents promise to refrain from using the term "old phart" when referring to CW enthusiests.

2. In return, proponents of Morse code will agree that given infinite dollars, digital signal processing system can approach the performance of a trained CW operator. The only exception is emergency conditions on a deserted island where only a single transistor, a battery and a 20 ft length of wire is available.

3. Both sides agree to welcome all newcomers to the hobby whether they enter with or without code credentials.

4. Both sides agree to stop blaming the mess on [insert whatever band you think is most messed up] on the existence or lack of any licensing requirement.

5. Both sides agree to spend more time enjoying the hobby of amateur radio and less time flaming on the net.

6. Both sides agree that neither side has a monopoly on their ability to fullfill the stated FCC goals for the amateur radio service: : public service, advancing the radio art, advancing communication and technical skills, expanding the reservoir of trained operators/technicians/electronics experts and enhancing international goodwill.

4545. Renewal of expired General Class ticket

Newsgroup: rec.ham-radio
Date: 1990-12-21 05:35:09 UTC
From: mac@pangea.Stanford.EDU
Message-ID: <1990Dec21.053509.19993@morrow.stanford.edu>
Source record: 5155

Please forgive this elementary question folks; its been a long time. I held a General Class ticket from about 1963 to 1975 when I left the US for Australia.

Simple question: Can I get the license re-instated simply, or must I take the written and code tests again?

Reply by e-mail; thanks.

Well, as long as its 5 to 1 against your position, I may as well add mine. I tend to feel that ham radio already has several self filtering and self policing mechanisms that keep it pretty much in line. Most individuals who go after ham licenses are going to be technically oriented, or at least have a mind tuned to understanding logical left-brained concepts. While it may be true that you could have absorbed the tech material in one sitting (I did it in one evening :) there are many people out there who cannot, either by ignorance or sheer stupidity. Those are the people that get filtered out.

Amateur radio also has a proud tradition of Elmering and self-policing. Implicit in hamming is the statement "this is serious radio, behave accordingly." Let's face it, you didn't REALLY learn how to become a ham until after considerable "on the job training" and guidance by other hams. I think this far overshadows any influence a "sincerity" test would have. The sincerity test is when a new licensee gets on the air and "pays his dues" by operating and honing his skills.

CB is not a very good example. Since there were NO filters, the service was not respected. If you want people to respect something, they need to work for it. Also, there was no clearcut purpose to the service, it was overloaded by unscrupulous equipment manufacturers, there was no guidance or elmering by other CBers, and the FCC saw it as a way of allocating an unwanted band and filling the Treasury coffer with mail-in licenses.

I am in favor of no-code above 30 Mhz, not because it would increase the number of hams, but because there is no compelling need to know code for VHF operation. Other Western countries have successfully implemented such a license, why do we remain behind the times?

A written exam given by an HONEST VE system (which it is, mostly) would encourage respect for the hobby. The tradition of self-training and policing would make these new licencees model hams. I think it would be a severe violation of the amateur fraternity to engage in childish stunts like appending your call with a /C. I will certainly welcome these new licencees to the hobby enthusiastically.

Just my opinion....

>follows a b-tree. Sounds pretty digital to me. I always thought a CW
>transmitter was either ON or OFF, which also sounds distinctly digital.

Encoding: The translation of intelligence into a form suitable to be
transmited. Here the encoding of words formed from the English
Alphabet into Morse Code bi-state timings.

Modulation: The method of impressing an encoding onto the medium. Here
the use of variable length on-off keying, a form of AM pulse
modulation. Morse could be sent using FSK modulation with the
marks corresponding to an "on" state and spaces corresponding to
the "off" state, it would work better under selective fading due
to the extra redundancy.

>As for CW being an AM mode, that's a bit of a stretch. While CW takes
>on two amplitudes there is no information in the amplitude itself.
>Also, the sidebands are zero-width.

Not true. The two amplitudes (on and off) along with the duration of the
pulses *are* the modulation that, after demodulation, can be decoded back
into the original intelligence through the use of a Morse Decoder. The
decoder can be organo-chemical or silicon-electrical.

The sidebands of on-off keyed signals are not zero. From the ARRL
Handbook 1982 page 11-1, "On-off keying is a form of amplitude modulation
and, as such, generates sidebands whose spacing from the carrier is
proportional to the keying speed. A keying speed of 12 wpm corresponds to an

information rate of 5 Hz, which theoretically requires 10 Hz bandwidth.
A keying waveform, however, approaches square-wave modulation, consisting
of the keying frequency plus all of the odd harmonics." This is why filters
narrower than a couple hundred hertz can't successfully be used to copy
CW. The bit edges become smeared (ringing) when all the odd harmonics
are stripped off.

Remember that Morse Code is not the beeps that you hear, it is the duration
and spacing of the waveform envelopes that carry the encoding.

>rec.radio.ham.swap (from rec.ham-radio.swap)
>rec.radio.ham.tech

I strongly support this alignment, especially changing rec.ham-radio to rec.radio.ham.misc as this should cut down on inappropriate cross-posts. I am also strongly in favor of a tech group where less heat and more light can be thrown on such subjects as modulation methods and encodings. I seriously doubt that legal will be widely read or posted to, but maybe that's just as well.

Assuming I've interpreted your broken English correctly, you're attempting to explain away my (and others) position on the classless amateur radio license as an attempt to gain privileges without being qualified for them, specifically lacking "the answers to more theory".

While it undoubtedly makes you feel warm inside to have discovered the base and ulterior motives behind this attempt at reform, let me caution you not to feel too good about it - because you're wrong.

Let me remind you that when I and many others took the Technician license exam, the only difference between the Tech and General license WAS the code speed. The "theory" (and regs) part of the exam was exactly the same, which completely negates your argument about "few if any General" licensees.

And while I can't speak to the qualifications of other long-time Technician licensees (I don't know, and unlike you, I'm unwilling to condemn them without facts), it's not the theory that made the difference. If you require proof, I'll wave my 1st phone (with radar) license under your nose. I earned it a year or so after I got my Tech ham license - just after I graduated from high school. The jobs I held in industrial and broadcast radio required it.

Except for packet radio on two meters, you'll rarely find me below 420 MHz. I've little use for HF; the telephone works better and cheaper.

ARRL/VEC NEWS RELEASE December 14, 1990

To: All ARRL VE Team Liaisons

From: Bart J. Jahnke. KB9NM. ARRL/VEC Manager

FOR IMMEDIATE RELEASE

FCC CREATES CODELESS CLASS OF AMATEUR RADIO LICENSE

For the first time ever, starting in February it will be possible to obtain an Amateur Radio license in the United States without passing a Morse code test. This was announced by the FCC at its open meeting yesterday, December 13th. The Federal Communications Commissions (FCC) has eliminated the need for new Technician class Amateur Radio license applicants to demonstrate proficiency in Morse code in order to have all amateur privileges above 30 MHz. The implementation date may be as early as February 1991. Technicians who obtain their licenses prior to that date will be grandfathered, meaning their existing HF privileges will continue.

The codeless Technician written examination will have 55 questions (existing Elements 2 and 3A). New Technicians wishing to gain access to the HF privileges below 30 MHz will be required to pass the Element 1A (5 WPM) Morse code test before three Volunteer Examiners accredited by Volunteer Examiner Coordinators, and will be given a Certificate of Successful Completion of Examination (CSCE) to serve as evidence of their qualifications. That CSCE must be retained by them in perpetuity to prove they have met the requirement to gain access to the Novice HF bands. Novices wishing to upgrade to Technician must pass Element 3A to gain the VHF privileges of the Technician class. Novices will need to retain a copy (preferably the original) of their Novice license in order to show that they have met the 5 WPM requirment for HF band access. This is because there will be no call sign designator to indicate Technicians who have or have not passed a code test. VECs will supply the FCC with a list of those codeless Technicians who passed element 1A.

There has been no change to the Novice license in any way, nor has there been any change made above the Technician class. Novice examinations will continue to be available both by two Novice examiners (no test fee), or by three accredited VEs (no test fee if only elements 1A and 2 are involved). The FCC decided to retain the current Novice Class operator license as an alternate entry level license for those persons able to pass the 5 WPM Morse code test instead of the more comprehensive written exam required for the

Technician Class license.

At a press briefing held just after the Commission's meeting, FCC Private Radio Bureau Chief Ralph Haller said "The Amateur Service is not growing as it should relative to what it has to offer." He said that the Amateur Service is where our nation's technical expertise comes from--that the changes should attract people who are interested in computers and digital communications, and should help the US to become more competitive.

In a news release today, ARRL President Larry Price, W4RA noted with pleasure that the Commission had decided to retain the Novice license as a means of entry into Amateur Radio and to adopt a codeless license with a meaningful written examination requirement. "Our members were very strong on both of these points, because they couldn't imagine how we could maintain the character of the Amateuer Radio Service without them," Mr. Price said.

Presiden Price sounded a note of caution with the privileges the Commission plans to grant codeless licesees. He indicated that the formula developed by the ARRL Board, which called for privileges above 220 MHz, was based upon extensive membership input. It was carefully balanced to offer attractive privileges while protecting existing patterns of amateur activity. While it will take some time to gauge the reaction to the Commission's action, Mr. Price observed that the FCC formula is likely to be less acceptable to many amateurs than the League's. He asks that League members share their views with their elected Directors, who will collectivly determine League policy.

"Before we can decide whether to request that the Commisson partially reconsider its action, we'll have to see the Report and Order," said Mr. Price. Usually it takes the FCC from several days to several weeks after a Commisson action to release an itemn after editorial review. There is a 30 day window of opportunity following release in which petitions for recondsideration can be filed. Mr. Price noted that ARRL Board was holding its regular meeting on January 18-19 1991. "The timing looks good for a careful review of the Commission's action at that meeting," he said.

MORSE CODE EXEMPTIONS FOR HANDICAPPED OR DISABLED AMATEURS

FCC also announced yesterday that it has amended its rules to make the Amateur Service more accessible to the handicapped or disabled licensees who are unable to pass a higher speed Morse code examination.

The FCC decide to declined to provide a list of disabilities; instead, the judgment of a qualified physician will be relied on to detrmine that a person cannot pass a Morse code examination due to a severe handicap.

In response to concerns about the integrity of the process, FCC staff said anyone abusing the process would be dealt with harshly.

The FCC afirmed that because of international requirements, no examptions would be granted for the 5 WPM Morse code requirement.

As we understand it, Element 1C credit will be given by VEs to applicants presenting a correctly completed DOCTOR's CERTIFICATION. The FCC indicated that the physician will be relied upon to make the appropriate certification and that the certification will include permission for release of mediacal information to the FCC. Ralf Haller. or the FCC, said that the 610 form may be modified to require the certifying physician's signature on the form near the US Code Title 18 Reference which states. "Willful false statements made on this form or attachments are punishable by fine and imprisonment."

More specific information will be provided to you though the next VE EXPRESS newsletter upon receipt of the Report and Order documents on both of the above news items.

I'd like to give this issue a stab. The modulation of RF refers to what
you do to the base RF signal. For instance, start with a constant amplitude
RF signal and chop it on/off (a la CW). This is an AM mode, since any info-
rmation is being conveyed via amplitude changes. The modulating signal is
digital in nature, since it consists of on/off pulses. (one could claim CW
is a combination of pulse-position/pulse width modulation, but I digress).
If you take the same digital on/off signal and apply it to a tone generator
and feed this into an FM transmitter, you get an FM style mode. In this
case the carrier is on all the time, and the information is contained in
the FM sidebands. A real-life example of a complex waveform is the APT
format sent by wx satellites. The RF transmission is medium width FM, but
the modulating signal is an amplitude modulated 2400Hz tone that represents
image data. The confusion arises in that for HF packet you use two tones
to encode your HDLC data, but feed them into a SSB transmitter. What you
get it still a SSB signal, but the encoding of the data is indeed frequency
modulation (also known as frequency shift keying, FSK). If I were to choose
a single tone with two distinct amplitude levels as my input to the SSB trans-
mitter, I'd still have a SSB signal on the air, but the encoding of your HDLC
data would now be AM in nature. I hope this helps clear things up.

> it from what it was. But i don't think it makes a big difference either way.

EXCUSE ME?!?!? What do you think computers and fancy user interfaces
are for? Even if I did have to type some long drawn-out newsgroup
name, I'd probably just cut-and-paste it on my DMD with the mouse!

My Canadian Radio License says "AMATEUR". In my own eyes I am not a
"ham". Period. I don't use the term (unless it slips out when I'm in
conversation with others using it), and I don't like it. It grates on
my nerves. I know many others who feel the same. In the real world
it is just as easy to type, write, and say "amateur". It is more
correct and proper to do so, and it doesn't convey nearly so many
negative connotations. As you can probably tell it does make a big
difference to me, and I'll guarantee it'll make a big difference to
many potential amateur's in the USENET communitee.

I'm not advocating a ban of the term "ham", though, by any stretch of
the imagination. I only want to be extra careful about not using it
in prominent places like newsgroup names. It's a slang term
(definition #4 in Webster's), and I've no objection to it being used
as such in everyday speech. In my opinion anyone using it in written
form, especially in more formal writing, is debasing themselves.

I do, however, agree with the .misc subgroup, and I've given up even
thinking about .legal vs. .regs.

I still *strongly* prefer .digital over .packet. Packet is only one
of the digital modes. In actual fact .net might be better for the
future if we are to encourage proper networking.

Again my (slightly modified) proposal is the following:

rec.radio.amateur.legal
rec.radio.amateur.misc (from rec.ham-radio)
rec.radio.amateur.digital (from rec.ham-radio.packet)
rec.radio.amateur.swap (from rec.ham-radio.swap)
rec.radio.amateur.tech

Django - DL5YEC,
I did not know how to reach you other then via this list.
I have a few question to ask about the program? I am not
able to access com1. Was that designed that way? I would
like to know how the program works. Thank you for your
help.

I am but a *voyeur* of these conversations about ham radio, and only occasionally that. As an *old-timer* (W4DHK since '54) the passions aren't what they used to be; and they are spread over a lot of other areas of interest, activity, and concern. I am still somewhat involved - having sat for my Advanced and Extra class tickets last Spring, gone to a couple of *Hamfests* (why is that always so depressing?), and bought myself a new HF rig and keyer. Whoops.....hope that doesn't tip my fist....er....hand....as to what my position might be IF I were to join the debate about no-code licensing.

Actually, I really don't have a position on no-code. I see the passionate exchanges and find myself on both sides of the issue from time to time. There have been basic changes over the years which DID upset me, and which DID, I believe, have a detrimental impact on the service. But not this one. No-code was inevitable. No-theory tickets are not that far fetched, nor are they, IMHO, that far away. It really doesn't matter what you or I think is appropriate, or what is happening with the service and/or technology. The process has much more to do with economics, and with evolutionary trends in our society. You know what happened in commercial radio, and on the Citizen's Band. Take a look at some of the other federal agency certification processes; see what the FAA is doing, for instance, with the *pilots* license.

Telegraphy, I think everyone agrees, is an integral part of the history and tradition of ham radio. I have always enjoyed that aspect of the hobby a lot, and I feel that I always will. I have less fun with, and less need for, circuit design principles and formulas, and advanced electronic theory - having designed my first and last rig in 1954. But that is also an important aspect - more challenging and dynamic for sure; and I want to be competent in that area too. I don't *need* the electronic theory to be an amateur radio communicator - at least in the way that I enjoy it. And I can appreciate that others do not NEED code for what they want to do. But....come on....it is all so incredibly EASY! Why would anybody let any of it keep them out of this hobby?

I am an Academic Computing consultant at the University of Ky. My life has nothing to do with telegraphy OR electronics. And I was able, with modest effort, to pass the novice, general, advanced, and extra class exams - all on the first try; the latter two with perfect scores. Many of you, I know, have done the same. Any person with normal intelligence, a current ARRL study guide, and a low-end pocket calculator can prepare for and pass any FCC written exam. Throw in a little commitment and positive attitude and the code is just as easy. I have taught enough of it to know; anybody who wants to can learn it. Any-

one with the right attitude, a little commitment, and no particular learning disability, can become proficient. *Hazing* seems such a strange way to perceive such a trivial prerequisite. I remember when people used to talk about how stupid and unfair it was to have to learn about *radios* and navigation equipment and all that other dumb technical stuff - just to get a license to fly an airplane. They didn't want to study and practice (be hazed); they wanted to get out there and FLY! Well.....guess what folks; Now they can! Don't worry though. The special rules they operate under SHOULD keep them out of your airspace, and off of your approach paths - in most cases.

I say *welcome aboard* no-coders. Hope you enjoy our hobby and our fraternity, and that you continue to explore and discover and broaden your horizons.

4562. Packet on CB ; was: Re: No-code license

Newsgroup: rec.ham-radio

Source record: 5175

I, too, think packet on CB radio would be an excellent idea. For several reasons...

(1) The ban on business communications in ham radio is somewhat awkward. Amateur *computing* usually mixes business and hobby together. It's hard to separate them cleanly enough to satisfy ham requirements. (Such things as not sending shareware through the air.)

(2) Packet rigs have enough patience to out-wait even the most determined jammer or ratchetjaw.

But I'd rather get FCC approval first. And I'd like to use FM; perhaps we should petition the FCC to allow FM packet on CB?

>And how many people know what class "AA4MW" is? You would be suprised at
>the number of people who have gotten it wrong!

Let's see. 2x2. Must be an ADVANCED call!

Have you considered changing to a 7 call? I hand picked AA4KB back in '78
(AA4 Kick Butt -- it's a contester slogan) and I've been really loathe to
change for a local Extra call. Now I'd get AB6xx. Bleh. But, damn, I
do get tired of people asking me how long I'm going to be visiting California,
and in the Sweepstakes, I simply _had_ to sign AA4KB/6 so they would copy
SCV and not SC.

But naaaaaah! I'll stick with it. I held another great call: N6DE. When
I moved home to Memphis, and thought it would be permanent, I traded it in
for AA4KB (second choice to AA4TN). I would operate in the contests as
N6DE/4 ... and NOBODY could copy it!

"AA4MW DE N6DE/4 AR" "/4?"

Now that I'm home in California (since 1980), I'd DEARLY love to get N6DE
back. <sigh>

I don't think the code has helped me "learn good operating practices." In fact, beyond taking the code test to get my Novice, I have not used the code at all. I was communications officer for my CAP squadron years before I got my first Novice ticket (20 yeares ago). I was sent to the Air Force Communications School at Keesler AFB were I learned all about conducting Nets and procedures for point-to-point ground communications. All using SSB and no code.

>
I always enjoy making new friends over the air. Since one of my favorite modes is packet, I have spent hours sitting at the keyboard chatting with folks I'll probably never meet any other way. Perhaps I may even have the opportunity to chat with you, too. There are so many aspect to ham radio, find the ones you like and excell in those areas. I don't care for CW, but that is my personal choice. If someone else likes CW but not packet, that is fine too. I don't condem anyones choice of operating mode nor do I expect them to condem mine.>

As another "tech lifer", I'll throw another voice into this one.

>If you require proof, I'll wave my 1st phone (with radar)
>license under your nose.

Same here. I've always looked down upon hams that did not prove their
merit by also earning a 1st commercial. (not really, but that statement
kinda shows how ignorant the code booster sound.)

>I earned it a year or so after I got my Tech
>ham license

I took my Technician test, my 3rd, 2nd, and 1st tests all in the same
day. I considered my ham ticket just a license to talk; I considered
my 1st an achievement.

>Except for packet radio on two meters, you'll rarely find me below
>420 MHz. I've little use for HF; the telephone works better and cheaper.

Same here. At least at UHF, you don't have too many bARFbags floating
about.

I guess the best part about all this noise about no-code licenses is that
it does not matter. WE won, you lost and I'm going to savor the victory
for some time to come. That is until I get motivated to start working
for the total elimination of CW as a license requirement.

A toast to all those who worked so hard to make it happen!!! Let's do it
again.

>>
>The General (Comm'l) license is just wallpaper as someone else put it. No

Tell that to avionics technicians! They still need it. When I took the test a year or so ago, the test-waiting-area was heavily populated by people who wanted to work for United Airlines, which has a large repair depot in this area. As for difficulty, I would put it at about the level of the Advanced. As people in the testing room finished their tests, they went up and were graded on the spot. Passes seemed to be running about 50%...

Of course, the General Radiotelephone isn't needed for a lot of things the FCC used to license, like repairing CBs, being a broadcast station engineer, etc. The general principle seems to be that the FCC doesn't want to license anyone that they're not REQUIRED to license by INTERNATIONAL TREATY. Hence they still issue ham licenses and Marine radio licenses. Its too bad, in a way. Now, if you want to work at a radio station, you have to prove your proficiency some other way, like a degree, or prior experience...

>frequencies? Thanks.

Different police departments use different codes. There is a "common 10-code list" in the Radio Shack "Police Call" book, but it will be somewhat different from whatever police department you monitor.

And that's a big ten-four.

4581. Comments on YEASU FT-757 GX II

Newsgroup: rec.ham-radio
Date: 1990-12-22 02:12:53 UTC
From: IANR003@UNLVM.BITNET
Message-ID: <9012220219.AA29048@ucsd.edu>
Source record: 5189

I am interested in purchasing a YEASU FT-757 GX II radio. I like its small size, General coverage receive, and the fact that it comes with AM & FM built in. In addition, I like very much that the SQUELCH control is active in all modes, not just FM.

If anyone is interested in sending me comments concerning this radio, I would appreciate it. In addition, anyone with comments concerning other brand radios with basically the same features in the same price range (about $850) are certainly welcome to voice their opinions.

Thanks in Advance

Michael Ruhrdanz N0FER

>there is no voltage across it, and thus no power dissipation (P=EI).
>When the output stage is "OFF", there is no current through it, so again
>P=EI=0. In reality, of course, the "ON" resistance is never zero,
>and the switching time is never instantaneous, so the efficiency is
>not 100%. I believe actual efficiency is a strong function of the
>topology of the output filter network.

Class D power amps use push pull or complementary transistor pairs
and require only a simple series resonant output filter. A CMOS digital line
driver ought to make a nifty Class D QRP final. (I have some drivers on
order; if anything interesting comes out of it I will post and maybe write up
a magazine article.)

Class E power amps are single ended and require a C-L-C output network
with very particular reactance values. I found information on these in a book
called "Solid State Radio Engineering". I have played with these using power
MOSFET's at 184 kHz and measured 90+ percent efficiency. It is really tough
to get fast enough transitions for good efficency at HF.

Consider a AM transmitter that has a Class D or E final and a switching
mode modulator. About half the DC in comes out as energy in the sidebands.
Now consider a SSB transmitter with a 50 percent efficent linear final. Half
its DC in comes out as power in the 1 sideband. The received signal to noise
ratio (neglecting QRM) will be the same for any given amount of DC power in.
The AM system wins because the transmitter doesn't get hot and the receiver
can be simpler. Fidelity is better, too. (This is all at the expense of
twice the transmission bandwidth, of course.)

As quoted from <9012192258.AA00358@tilde> by dube@cpdvax.csc.ti.com:
+---------------
| memorize. Check it out. Round up 25 ticket-holders and give 'em a
| no-notice exam for their class of license. See how many pass.
+---------------

I would.

+---------------
| CB-ification will have been achieved. Can't happen, you say? Well, they
| said a No-Code Ham license would never happen several years ago. Never say
| Never.
+---------------

The theory is still relevant. Show me that Morse code is absolutely essential knowledge in order to be able to operate *all* amateur modes and I will concede the point.

The theory should not only be retained --- it should be enhanced. Updated to reflect the "leading-edge" we're SUPPOSED to be on. Made even more relevant. And the ancient CW requirement should really become a series of endorsements for *all* amateur modes: the existing CW exams, low-speed HF/VHF packet, high-speed packet, SSB, FM, SSTV, ATV, RTTY, AMTOR, SS, ... License upgrades would be based on earning a certain number of endorsements, e.g. Novice requires one endorsement, Tech two, General four, Advanced six, Extra eight. (Example only, the actual endorsements and requirements should be set by the FCC and ARRL or etc. working together.) Frequency privileges would be based on band plans and endorsements: someone with HF/VHF packet would be permitted to operate packet in the frequency ranges usually used for such, etc. Such frequency privileges and other limitations would also be based on the theory exam, so that e.g. you still need Tech theory to use high power on VHF and General theory to use it on HF, etc.

I *still* don't expect to see it happen. But I can hope. It's time amateur radio came out of the 1920s or thereabouts, don't you think?

Another "Amateur radio is CW and vice versa" posting by rec@chiton.ucsd.edu (Richard Currier):

```
+---------------
| Unfortunately this is not true. If you don't operate CW, build CW rigs, talk
| to DX OPs that run CW you can't know what is going on out there. You don't know
+---------------
```

If you don't operate SSTV, build SSTV rigs, talk to DX OPs that run SSTV you can't know what's going on out there. You don't know what you are missing....

C'mon, already. Your so-called argument is equally applicable to all other amateur modes, so it doesn't prove that CW is the GOD MODE.

And yes, I *have* heard liddishness on CW. Less than I've heard on HF SSB, but more than I've heard on packet. I should thereby conclude that packet is the best mode?

Would you please stop kidding yourself and recognize that CW is *one* mode of many, not the Lord Highest God Of All Radio Modes Now And Forever, Amen?

4586. Re: Codeless question pool?

Newsgroup: rec.ham-radio
Date: 1990-12-22 03:56:44 UTC
From: allbery@NCoast.ORG
Message-ID: <1990Dec22.035644.13870@NCoast.ORG>
Source record: 5197

As quoted from <49@bootsie.UUCP> by olson@bootsie.UUCP (Eric Olson):
+---------------
| I'm confused. Forgive me if this is a dumb question.
|
| The question list I have has elements 2A,B,C,D,E,F,G,H,I;
| 3A,B,C,D,E,F,G,H,I; etc. I see references to Novice being
| element 2, and the codeless tech being 3A, or 3A and 3B.
+---------------

The tests themselves are Elements 2 (Novice), 3A (Tech), 3B (General), 4A (Advanced), 4B (Extra). Each test has a specific number of questions drawn from each section of the appropriate Question Pool.

The Question Pools' sections are *also* labeled; it is those labels you are looking at. A given question is identified by the test, question pool section and subsection, and question number within the subsection. Thus, we have question labels like "4AD-6.1", indicating test 4A (Advanced theory), section D, subsection 6, question 1. By and large, the questions in a given subsection are all rephrasings/reverse presentations/etc. of the same basic point of theory or law.

SB RTTYDX @ ALLBBS $RTDX1221B
RTTY DX Notes 3of3 12/21/90

RTTY DX Notes for week ending 21st December 1990
BID: $RTDX1221B
Part 3 of 3.

HP1XZD receives his cards via Panatronics S.A., Attn Bill Draper, Box 2016, Balboa, Panama.

N4WFM/C6A says to QSL to Jeanie Duff, P.o. Box 40842, Reno, NV 89504-4942 USA.

FO5ED lives in Box 1746, Papeete, Tahiti.

VP2EE will QSL via KA3DBN, John L. Rouse, 2703 Bartlett Lane, Bowie, MD 20715-3911 USA.

Notes of Interest:

PA3DUU will operate from Morokulien signing LG5LG (on the Swedish/Norway border. Yes we have put him back where he belongs. Thanks, Jules) from December 22nd until 29th. QSL to LA5DFA. There is no DXCC status for this place.

3W3RR will sign YA0RR from January 1st for a three week period. He will operate RTTY for 10 of those days and will QSL via DIMA,

UT5RP. Romeo says that Spratley has been delayed until later due to the Afghanastan operation. Send any donations to NT2X, Edward Kritsky, P.O. Box 300715, Brooklyn, NY 11230-0010.

HA9RE and HA8XX will tour the South Pacific for the next 6 or 8 weeks and will call at Chatham Island, Raratonga and Nuie Islands during their itinerary. QSL via DJ1ND.

4X6UO says that from 30th December for 2 months 4Z80TA will celebrate the 80th anniversary of the municipality of Tel Aviv.

We might as well put VE8RCS back in their right place on Ellismere Island, which is more than 40km from the North Pole (geographically or magnetic). But at least VE8XU is in Zone 1 (Thanks again Jules, I do try to be perfect, but don't always succeed).

A Merry XMAS to you all. Don't eat too much.

GL DE DX1 (VK2SG).

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 1 of 5

MEMBERS CHOOSE NEW DIRECTORS

ARRL members in the Northwestern and West Gulf Divisions have voted to send new representatives to the ARRL Board, and in the Hudson Division have returned the incumbent to office for another term. Ballots in these and two other contested elections for 1991-1992 terms of office were counted by the Committee of Tellers November 20 at League Headquarters.

The Northwestern Division race was between Mary Lewis, W7QGP, the present ARRL Section Manager of Western Washington and a past Director of the Divison, and incumbent Bill Shrader, W7QMU. Shrader advanced from the position of Vice Director to Director a year ago following the resignation of Rush Drake, W7RM, for health reasons. Lewis was elected by a margin of 110 votes, 2,382 to 2,272. The incumbent Vice Director, Mary Lou Brown, NM7N, was unopposed for reelection.

In the West Gulf Division, the incumbent Director, Sam Sitton, KV5X, had moved up to that position from Vice Director in January following the election of Jim Haynie, WB5JBP, as an ARRL Vice President. Tom Comstock, N5TC, a past Vice Director, had been appointed to fill the Vice Director vacancy. For the new term, however, Sitton decided to run for Vice Director and was elected without opposition. Comstock ran for Director and was elected over Rik Albury, W5SOQ, by a margin of 2,641 to 1,234.

In the Hudson Division, Director Steve Mendelsohn, WA2DHF, was returned for a third term. In a replay of the 1988 election, Mendelsohn bested Vincent Biancomano, WB2EZG, 2,898 to 1,235. Vice Director Paul Vydareny, WB2VUK, was unopposed for reelection.

The other contests this year were for the Vice Director positions in the Rocky Mountain and Central Divisions.

In the Rocky Mountain Vice Director contest, where the incumbent was not seeking reelection, Bob Scupp, WB5YYX, defeated past Director Lys Carey, K0PGM, by the narrowest margin of the year: 948 to 925. Director Marshall Quiat, AG0X, was reelected without opposition.

In the Central Division, in the only three-way race of the year, incumbent Vice Director Howie Huntington, K9KM, defeated challengers Mike Hoshiko, W9CJW, and Ken Ebneter, K9EN. The three received 2,231, 1,065, and 928 votes respectively. Director Ed Metzger, W9PRN, previously had been declared reelected as the only eligible candidate.

The newly elected League officials take office at noon January 1, 1991, along with the Directors and Vice Directors previously declared elected without opposition in the New England, Roanoke, and Southwestern Divisions.

W1AW TO SHIFT 15 AND 10 M CW FREQUENCIES

Effective January 2, 1991, W1AW will transmit its code practice and CW bulletins on new frequencies in the 15 and 10 meter bands. The change is being made to avoid interference between W1AW and AMTOR operations, which have become very popular near the old frequencies that had been used by W1AW for many years.

The new frequencies will be 21.0675 and 28.0675 MHz, 10 kHz lower than the old frequencies.

HAMS HELP TRACK ANOTHER ALLEGED JAMMER

Another alleged radio jammer has been silenced due in part to the efforts of Amateur Radio operators. On November 6 U.S. marshals and engineers from the FCC's Langhorne, PA field office seized radio equipment, belonging to Ernest Woods, 30, of Norristown, believed to have been used to interfere with Philadelphia-area 2-meter Amateur repeaters, as well as frequencies of the Pennsylvania State Police, the Norristown fire department, and other public service agencies.

Woods could face serious civil and criminal charges as a result. Woods was issued Novice class amateur license KA3WHZ in May 1990 and a Technician license in August.

In late June users of the Telford (PA) Area Repeater Association (TARA) began to experience "persistent and purposeful interference" to their 145.190 MHz repeater. In early August the TARA executive committee and TARA's control operators met to discuss the situation, after the jammer had gotten access, apparently through trial and error, to the repeater's phone patch and speed dial codes.

Concerned for the integrity of the repeater's emergency service codes, TARA on August 8 changed these services to "controlled access," and at the same time began efforts to pinpoint the source of the interfering signal. Standard Amateur fox-hunting techniques soon narrowed the source of the signal to a neighborhood of Norristown, about 20 miles from downtown Philadelphia.

On August 27 a preliminary formal complaint--with tape recordings--was filed by TARA's president with the Engineer in Charge of the FCC field office in Langhorne, PA. Area ARRL and repeater officials were at that

time notified of the situation.

On September 2, a team once again tracked "Barney," as they called the jammer, and concluded that additional equipment would be needed to positively identify the specific house from which the signal was being transmitted.

On September 6 a TARA official and one from the Fairview Village 2-meter repeater joined forces, using a Doppler Systems direction finding unit to localize the source of the signal to the same area.

Four days later, a station wss copied interfering with several Pennsylvania State Police channels in the 159-MHz range. A TARA official monitored the police frequencies long enough to confirm to his satisfaction that the interfering operator probably was the TARA repeater jammer.

TARA informed the Pennsylvania State Police of their on- going search for their repeater jammer, and were told the cops had been forced to move to alternate frequencies because of the jammer.

As word spread through various agencies, interference to the state police continued, with Barney telling the troopers to "drop dead" and at one point making a false report of an accident.

By Sept. 12 the FCC had stepped in, to act on complaints both from TARA and from the state police. Engineer-in-Charge John Rahtes asked for TARA's assistance: Rahtes needed a safe house in the immediate neighborhood where his agency could set up equipment to monitor the jammer, identify him, and gather legal evidence.

A vacant third floor apartment was located a half-block from the suspected source of the signal and the FCC installed its equipment, including gear capable of identifying transmitters by their signal signatures. TARA personnel assisted the FCC in monitoring over the next few weeks.
. . . . Continued next part

HAMS HELP TRACK ANOTHER ALLEGED JAMMER - (Continued)

"Barney" feels the heat

Barney at this point apparently became suspicious and for several days curtailed his transmitting.

Additional transmissions were noted on the TARA repeater, and on state police, county radio, and the Norristown Fire Department frequencies, as Barney gradually resumed operations beginning the weekend of Sept. 15-16. FCC engineers meanwhile narrowed the source down to a particular house in the congested area.

For the next two weeks monitoring increased, as efforts began to identify the occupants of the house, which appeared to be divided into apartments. Any search warrant issued would have to be for a specific

apartment rather than for the whole building.

At the end of September the U.S. Attorney was presented with evidence gathered up to that time. Montgomery County Communications Chief Dennis Parker and Norristown Fire Department Chief Joe DeDominic were asked to provide evidence they had gathered about interference to their operations and to file formal complaints.

In early October the jamming increased, and included harrassment of the Norristown F.D. on Oct 20, 23, and 26. In one transmission Barney tried to recall several trucks from a fire call. By that time the fire department had filed a formal complaint with the FCC.

On Oct. 19, U.S. marshals and FCC personnel, acting on a search warrant issued by the U.S. Attorney, entered the suspect house. But no radio equipment was found.

Although the raid was a disappointment, the FCC continued its probe. The landlord of the row house next to the house that had been searched told Rahtes that one of his tenants was known to have several radios and antennas in his room at the front of the building. The landlord supplied additional information, such as the tenant's work hours, which seemed to confirm that this individual was indeed the likely suspect.

From the landlord's first floor apartment Rahtes took field strength measurements, and was able to hear Barney operating his equipment through the thin walls of the building.

On Nov 1, the Radio Amateur Civil Emergency Service repeater in Eagleville, PA, reported unauthorized access to its 911 emergency system. RACES net members were being beeped day and night, adding to the FCC's case for securing another search warrant, which soon was issued.

TARA president E.C. "Gene" Pressler, W3ZXV, joined FCC personnel and U.S. marshals to enter the suspect premises. Several pieces of radio equipment were discovered, along with a directional antenna suspended from the ceiling, and other evidence.

Pressler then operated the suspect's equipment as FCC engineers Barry Peahota and Frank Hurst made recordings of the signal, for later signal and voice print analysis comparison with taped jamming transmissions.

Included among the equipment confiscated were two hand-held transceivers, as well as several scanners, most of which were in operation at the time of the search.

At presstime, no charges had yet been filed against Woods.

FCC TWEAKS AMATEUR RULES

The Federal Communications Commission has addressed a number of proposals for changes to its Part 97 Rules for the Amateur Service, in response to petitions by the ARRL as well as several individuals. The Commission's Notice of Proposed Rule Making in Docket 90-561 was released Nov. 16. Here are the highlights:

* The ARRL asked that the terms "telecommand," telemetry," and "space telemetry" be defined in the Rules; FCC agreed. The terms "tactical call sign" and "digipeater" will not be codified.

* ARRL sought an increase in the minimum number of club members necessary to apply for a club station license, from two to four. But the Commission noted that no new club station licenses have been issued for some 13 years and "we do not foresee that we will resume doing so," so the point was moot. The League continues to urge the Commission to resume the issuance of new club station licenses.

* FCC declined a request to amend its Rule that states an Amateur station must be independent of all other radio apparatus installed on a ship or aircraft. The League's argument in this case was that a regulation already is in place prohibiting an Amateur signal from interfering with other apparatus aboard.

* In the matter of prohibition of automatic control of Amateur stations when third party traffic is being handled, the League sought a rules revision to put the responsibility for the content of such traffic on the originating Amateur station. The Commission, however, maintained that traffic content is the responsibility of every station, including those who retransmit communications, and proposed no change.

In a related matter, ARRL sought a clarification of Section 97.109(d), to emphasize that a Commission representative may order an automatically controlled station to shut down because of improper operation or harmful interference only after the alleged offending station has been given the opportunity for a hearing.

FCC denied this, saying that "the control operator must cease automatic control of the station upon notification by an Engineer in Charge that the station is transmitting improperly or causing interference to other stations, and the licensee is not entitled to a hearing before such notification."

* The FCC declined to amend its Rules to permit retransmissions of other services--NOAA weather and DOC propagation broadcasts--saying such transmissions are "routinely available over the air with inexpensive receivers."

* The FCC agreed to amend its Rule regarding compensation of club station operators, lowering the number of simultaneous bands on which bulletins and code practice must be transmitted from ten to six.

* A request to ease the FCC Rules regarding third party communications on behalf of someone holding an Amateur Radio license but not

eligible to be a control operator of an FCC- licensed station was denied. The Commission said this had already been considered (in the most recent Rules rewrite) and denied at that time.

* A request by an individual Amateur to require stations to identify at the beginning of communications through a repeater was not included in the proposals, but FCC asked for comments in the matter.

* FCC declined to entertain a change in its Rules to incorporate due-process procedures in cases involving "quiet hours," saying that it was unnecessary.

* In the area of Special Operations, FCC agreed to:

1. Amend its Rules to delete the condition that an auxiliary station can be automatically controlled only when it is part of a repeater system, so that Amateur operators can experiment with new system configurations that use auxiliary links;

2. Expand the permissible types of space telemetry transmissions as requested by the ARRL;

3. Make minor changes in wording, including changing "remote control" to "telecommand."

* The FCC once again refused to change its Rules banning 10-meter power amplifiers, saying the ban "makes our enforcement procedures more efficient and effective."

* A request that persons whose Amateur station or operator license has been revoked or suspended be allowed to qualify as a volunteer examiner after a 10-year period was turned down.

Interested parties may file comments on or before Jan. 31, 1991; reply comments are due by March 4, 1991. Extensions of time are not contemplated, according to the FCC.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 5 of 5

NEWS FROM CANADA

* The Canadian Radio Relay League and the Canadian Amateur Radio Federation met Oct. 14 to discuss a merger of the two groups. A draft constitution for a new, single Canadian organization was updated based on comments from boards of directors of the two bodies. The merger committee plans another meeting early in December, and tentative plans were made for the CRRL board and the CARF annual general meeting to be held "in a common location" in June, 1991.

* It may take a massive letter-writing campaign to Canada's Department of Commerce to get the new "Client Procedures Circular" rescinded, according to CRRL. The CPC, which will be published in its entirety in the December issue of QST Canada, is subtitled "Municipal Consultation on Non- Broadcasting Antennas," and is characterized by

CRRL as "so poorly crafted that it lends itself to all kinds of interpretations and arbitrary decisions."

* Regarding new (as of Oct. 1) Canadian regulations based on the bandwidth of transmitted signals, that 1200-baud packet operation falls within the 6-kHz maximum bandwidth allowed on 160-12 meters (except 30 meters). CRRL and CARF ask that Amateurs NOT use 1200-baud packet on the HF bands "until the CRRL and CARF form a band planning committee and the matter has been studied."

CONFERENCE HONORS ARMSTRONG

Edwin Howard Armstrong, "the Major," would have been 100 years old this year. The centennial of his birth has spawned a number of projects and retrospectives, the latest of which was a conference held Nov. 16 at Columbia University, his alma mater and where for many years he was a faculty member.

Attending the conference, held at the Columbia Center for Telecommunications and Information Studies in New York City, was ARRL Executive Vice President David Sumner, K1ZZ. Sumner participated in discussions of papers presented at the conference, particularly those concerned with the commercial development of FM (which Armstrong invented) in the U.S.

Maj. Armstrong was widely regarded as having strong roots in Amateur Radio. Although his experimentation as a "ham" predated licensing, Armstrong helped build and operate the Radio Club of America station 1BCG that was the first to be heard by the League's Paul Godley at Ardrossan, Scotland, in 1921.

It was just this sort of unstructured, "amateur" experimentation that Armstrong carried over into his many technical breakthroughs, which included invention of the regenerative circuit (1912); the superheterodyne (1917); and wide band FM (1933).

Also present at the conference was Thomas Lewis of Skidmore College, who is helping produce the film "Empire of the Air," a PBS documentary about the early days of broadcasting that is scheduled for airing next fall. Lewis is pictured with Bruce Kelley, W2ICE, in the Oct. 19 issue of The ARRL Letter.

PLEASE GO AWAY

Here is the latest list of intruders in our HF bands which the ARRL has asked FCC's Treaty Branch to pursue with other countries as well as our own:

* 1813-1820 kHz, A2A (beacon transmitters);
* 7008, F1 (TTY idling and traffic);
* 14221, R7B/F1B (250/500 Hz shift TTY and Mux);
* 14312, F1 (high speed digital keying, 1 kHz shift);
* 18090, F1 (140 baud encrypted, 500 Hz shift);

* 18095.5, F1 (idling signal, 2 kHz shift);
* 18125, F1 (50 baud, 400 Hz shift, some encryption);
* 18138.5, F1 (140 baud, encrypted).

BRIEFS

* The League's latest move against the reallocation of part of the 220 MHz band to commercial interests was played out in court Nov. 16, when oral arguments were presented by the ARRL as plaintiff and the FCC as defendant, to the U.S. Court of Appeals, D.C. circuit. A panel of three judges heard the arguments and questioned both sides in the request for judicial review. The Court's decision is expected in a few weeks.

* The preliminary position on the 40-meter band contained in the FCC's Second Notice of Inquiry in Docket 89-554 generally was supported at the final 1990 meeting of the FCC WARC-92 Advisory Committee's Informal Working Group No. 1, held in Washington Nov. 8, according to EVP K1ZZ, who attended as a member of the working group. Background on this can be found in the Oct. 5 issue of The ARRL Letter and in Nov. QST.

4589. Re: No-code: Cease Fire

Newsgroup: rec.ham-radio

Message-ID: <1990Dec22.140812.24792@athena.cs.uga.edu>
Source record: 5198

I wish it were possible to end the debate now, but the president of the ARRL is talking about petitioning the FCC to reconsider, and reduce the privileges of the no-code Technicians. (Apparently, there is a 30-day period after any decision during which petitions for reconsideration can be submitted.)

Write to the ARRL (don't just flame here!) if you object to this.

4590. Re: Code/No-code Tech Call Formats

Newsgroup: rec.ham-radio
Date: 1990-12-22 14:09:46 UTC

Source record: 5199

The FCC has not announced any change in callsign format. The new license will be a Technician license and will have the same kind of callsign that Technician does now.

Two other things may cause confusion:

(1) The original proposal was for a new class called Communicator with 2x3 calls.

(2) In areas 4 and 6, all the 1x3 calls are used up and even Generals (as well as Technicians) now get 2x3 calls.

]Wow. An FCC that is more enlightened than the League that
]represents us! Do you really mean that us folks who still see
]Ham radio as a technical hobby do have a friend in Washington?

The ARRL represents its members. Since people who like to bash the
ARRL for old fashioned views don't seem to interested in joining
it and working from the inside, their views may be underrepresented.

The people on ARRL staff that I have worked with, and our Southwest
Division Director (Fried Hein) certainly don't fit your description.

I get really tired of ARRL bashing. At least they actually do something
to try to improve the hobby - within the limits set by their voting
members.

This as compared to Wayne Green, et. al., who are constantly carping
and harping and blowing their own horns.

Fancy user interfaces are for those who want to spend the extra money
to buy the extra CPU power to run them. Some of us want our CPU's working
on the problem at hand and not figuring out how to shade that button to make
it look 3-d. Some of us understand the DELETE command, and don't need cute
little pictures of wastebaskets. Some of those cute little pictures are so
cute they don't convey any information at all, until you know what they are.
If you have to learn what the picture means, why not just learn the command?

> My Canadian Radio License says "AMATEUR".

My U.S. one says Amateur, too. So what?

> I don't use the term (unless it slips out when I'm in

I don't use the term unless I use the term, either.

> and I don't like it.

I don't like the generic classification as amateur. When I do things, I
don't try to do them in less than a professional manner.

> In the real world
> it is just as easy to type, write, and say "amateur".

Three letters are easier to type than 6 (different ones). Three letters
are easier to write than 7. "Ham" is written as it is pronounced. "Amateur"
has one of those odd spellings you need to memorize. Lessee -- amature?
Amatur? Amatchur? Ham. Ham. Ham.

> It's a slang term
> (definition #4 in Webster's), and I've no objection to it being used
> as such in everyday speech.

At least "ham" HAS a radio definition, instead of the negative definition
of the word "amateur" which completely ignores the radio usage.

> In my opinion anyone using it in written
> form, especially in more formal writing, is debasing themselves.

Is this another guideline for USEnet? USEnet is formal writing? Do you
complain about the usage of "rec" for "recreation", and "biz" for "business"?

>wave.

A gross generalization, a transmitter with "tuning knob thingies" will
be more efficient than a no tune design. The obvious exception is a
fixed frequency unit with a well characterized load. Since we rarely
have that in amateur service, put the knobs back on. Especially for
battery powered QRP, every little bit of efficiency counts.

Isn't it funny that we generally didn't need antenna tuners until the advent
of "no tune" radios. Now we have to have another box to do what the knobs
used to do on the radio, *and* often suffer more inefficiency in the process.
It's not cheap to get a loaded Q of 10 when the driving impedance is
0.02 ohm, but it's usually worth it in terms of efficiency. The tough
part is the inital stepup transform to an impedance where reasonably
sized components can be used.

In my opinion the commercially made rigs went to no tune so they could push
the price of the matching network into another box and make the radios appear
cheaper and smaller while removing a design headache and producing a little
marketing hype. We don't have to do that in our own designs.

> keep them out of this hobby?

Ah, but current licensees are a self selected sample of the population who found the code EASY, or beat their heads against the barrier for month after month because they were too stubborn to let it keep them out of amateur radio. We don't have good evidence that a large segment of the population doesn't find the code HARD to learn. We are now embarking on an experiment that will let us find out for sure. If our ranks don't swell with the new no code techs, then, at least we'll know for sure that they weren't being kept out by the code being hard for them to learn. Then we'd have to take a very hard look at our hobby and try to figure out what makes it so unpopular with the public other than the code requirement. I have some ideas about what's wrong with the hobby other than presumed archaic licensing requirements, but let's wait and see before starting another crusade.

Well Al, lots of my Vietnam era buddies ran ham patches with the duty
radios on US ships. Course lots of those ships had guns on them. :-)
I have a friend who is currently radio officer on a US flag ship and
he says that getting permission to run ham radio is as simple as asking
the captain's permission. At least in his case, the captain said, "Sure,
as long as you don't interfere with the normal navs and comms." Since
my friend is responsible for making sure the navs and comms work as
his primary duty, this was not a problem.

Now to answer the original poster's question. Your best bet will be
20 or 15 meters with at least 100 watts output. It won't work every
day, but should be usable quite often.

>license will be yakking on 2 mtr repeaters. They will all be showing
>us how antiquated our other modes are if we aren't using DSP....

Some of the real experimental work going on around here is with full duplex repeaters with such rudimentary digital processing as digital AGC, digital adaptive squelch, digital filtering, digital links and digital voters, digital generation and detection of DTMF tones, and fully digital voice mail. Few folks bother with simplex anymore for the very good reason that it limits the number of stations that can be worked without access to good sites and high power and because it *is* old hat. They want to try building *systems* that have more power and flexibility than single user simplex offers. So if you pass through and happen to work someone on one of these *systems*, be impressed at the high level of experimental work going on.

And if you want to pass a few megabytes of data while you're here, try out the GRAPES 56 kilobaud packet network.

And it should be noted that neither of the two systems described would have been possible without the help of some dedicated and talented NON-amateurs. Thankfully those people are now going to get licensed through the new tech license and finally be able to *use* the systems they helped create. You see, they're some of the ones who find manual Morse Code impossible to learn.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

It would be a great place to transmit several hours of all 1990 W1AW bulletins, DX notes, and propagation forecasts to date, followed by 20 wpm code practice for Extras.

When you finish, turn the AMTOR loose chirping for a contact.

Jon Bloom would probably disagree. He thinks that the FCC should nitpick at us for trivial violations whilst the taxicabs merrily ply their trade. However, if you ARE cited, threaten the FCC with an appeal to the U.S. District Court, charging the FCC is discriminating by enforcing the Communications Act selectively and unequally.

Gee, some of the real anti-nocode folks warned that this was the ultimate
hidden agenda, but I scarcely believed it. Since I got involved in ham
radio, all aspects of the exams have gotten easier and easier. I suppose
some folks wont be happy until there is no exam at all.

Grrrr! I always wondered if te ARRL's support for no-code was a sham. Anyway,
I'm sending e-mail to HQ with CC: to Wayne and Fred.

>Write to the ARRL (don't just flame here!) if you object to this.

I did. I wrote a letter to Larry Price and copied it to my
Division Director and Section Manager (yeah, yeah, I know Steve
is on the net :-). And I encourage everyone else, even those
who are not Hams yet, to write. Since non-Hams may not read
QST yet, the address to send your "Christmas cards" to is

Larry E. Price, W4RA
President, ARRL
P. O. Box 2067
Statesboro, GA 30458

I believe mail from potential Hams can be even more powerful
than those who already are members of the ARRL. Get off your buns
and write!

I told Price, in terms that bureaucrats may understand, that any
reduction in the privileges for the newcomers would leave them
with less that a favourable impression of the ARRL once these
new folks get their licenses. What I didn't tell him was he
would be lucky if any of these folks would even consider joining
the ARRL if they had been screwed by the League.

I am particularly p*ssed because what the FCC did was probably the
most intellegent thing I have seen a government agency do. And
petty ARRL is going to muck it up. In my short one page comment
to the FCC in August regarding Docket 90-55 (probably on record
somewhere in the dungeons of Washington; and I posted it on the
net, too), I wrote

Specifically, if the codeless class were to be
administered examinations on theory and rules and
regulations commensurate to that administered
to the Technician Class operators, then there is
little just reason why they should not be accorded
the same right and privileges as a Technician Class
licensee in the Radio spectrum above 30 MHz.

Except for a spelling mistake that I later caught (hey, what do you expect from us furriners :-), those were the precise words I used. The FCC went one better. They *called* this new class of license "Technicians!" See why I am mad at the ARRL?

4607. Wanted: List of Weather Satellites and Freqs on 136/137 MHz

Newsgroup: rec.ham-radio
Date: 1990-12-23 00:55:58 UTC
From: root@mjbtn.JOBSOFT.COM
Message-ID: <1548@mjbtn.JOBSOFT.COM>
Source record: 5210
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Hello Netters,

I have been looking around for a semi-current list of *active* low-orbitting weather satellites that transmit FAX (AM) on the 136/137 MHz band. I bought a copy of the _Satellite Experimenter's Handbook_ at the ARRL table at Dayton last spring, but the most current ones it had listed were *1984*! Well, of course, the book is (c)1985 so that is not to out of the ordinary. I am sure there is a list somewhere, but I was hoping someone on the net might have a current one in an electronic form as I would like to redistribute it to our local group of satellite experimenters.

If anyone one can help out by emailing to me, posting to the group, and/or pointing me to an FTP site or a printed version, I would be most grateful. I have been using TRAKSAT from Paul Traufler (latest version 2.55 from the RPV Astro BBS [213/541-7299] - shareware) along with the Keplerian elements posted here and have had a great deal of success. I would like to get a "complete" list to program more channels into my PRO-2004.

Speaking of the PRO-2004 - does anyone have any recommendations for some sort of low noise pre-amp to improve the sensitivity of the unit? I know that it is not the most sensitive in the world, but I had read that a pre-amp could really help out. I am concerned about the introduction of images and spurs that pre-amps sometimes create. Anyone got any favorites?

Thanks in advance and Merry Christmas and Happy New Year!

73's,

Mark.

4608. Re: Is it citable to interfere with a unlicensed station?

Newsgroup: rec.ham-radio
Date: 1990-12-23 01:50:26 UTC
From: Justin_Randall_Padawer@cup.portal.com
Message-ID: <37172@cup.portal.com>
Source record: 5215

This is a wonderful question for discussion. Certainly one could make a great argument both ways. Here is my personal opinion:
DO NOT INTERFERE WITH ANY SIGNAL, LEGITIMATE OR OTHERWISE. The reason? Well, your signal may interfere with direction finding policing being done by someone else. I remember well how difficult it was to catch a local pirate a few years back because a couple of legitimate local hams thought the best strategy was to "jam" him on the air. Result: the legitimate "jammers" were making fools of themselves (again, my opinion), and it took much longer to try to catch the real pirate. We finally did catch him, after begging the locals to shut up. :-) Randy Padawer, WA4FJF

You can:

A) ftp/mailserv it from SIMTEL20 (PD2:<MSDOS2.HAMRADIO>SM316.ZIP)

B) get it from the CompuServe HAMNET forum (the author hangs out there)

C) try either WB3FFV's or N8EMR's bbses (numbers in their signatures)

D) your on your own at this point.... :-)

Hope this helps.

Mark.

4611. MAJOR SOLAR FLARE ALERT

Newsgroup: rec.ham-radio
Date: 1990-12-23 07:40:32 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901223004032.23801ff7@HG.ULeth.CA>
Source record: 5220

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 22, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare occurred at 22:46 UT on 22 December. The flare, rated a class M5.3/2B occurred from Region 6420 at a position of S25E63. This flare was not accompanied by any strong radio sweeps, but was associated with minor discrete radio emissions. The duration of the flare was 59 minutes. It began at 22:12 UT, peaked at 22:46 UT and ended at 23:11 UT.

Region 6420 is the second largest region on the sun at the present time. It is 1,380 million square kilometers in area and encompasses a total of 25 spots. The trailer spot complex of this region appears have some magnetic complexity associated with it, although this region is still classified as a magnetic Beta configuration.

Region 6412 (N17W68) is the largest region currently visible. This region has maintained a size of near 3,600 million square kilometers in area throughout its transit of the solar disk. It has increased in magnetic complexity from a Beta-type configuration to a Beta-Gamma configuration as of 22 December. It has not, however, spawned any significant solar flares.

Region 6415 has been very energetic this past week, producing numerous M-class flares. It was responsible for a class M4.3/1N flare at 23:21 UT on 22 December, which was associated with a Type II sweep. This region, however, is now rotating off the western limb and will not be visible on 23 December.

POTENTIAL TERRESTRIAL IMPACT FORECAST

Region 6420 may produce at least another major flare (and perhaps several more) as it transits the solar disk. Magnetic complexity in the trailer spot complex of this group will likely remain sufficient to spawn numerous M-class flares throughout the coming week. Expect numerous periods of radio distortion, SWF's and SID's on the sunlit hemisphere this week due to solar activity. As the active longitudes return between 26 and 28 December, expect M-class flaring to increase in frequency during the days with an accompanying increase in SID's and SWF's.

No significant terrestrial impacts are expected from today's major solar flare. However, if Region 6420 continues to produce significant flare

activity, the risk for terrestrial impacts will become likely within the next two to three days, particularly after 27 December.

Regions 6412 and 6415 (this weeks major spot groups) will rotate beyond the western limb by 24 December. However, by 26-28 December some potential major activity centers (aside from Region 6420) may reappear on the eastern limb. Models currently suggest that the activity associated with these returning solar longitudes should remain generally intact, although the associated regions will obviously have evolved since their disappearance two weeks ago. Judging by recent trends, it appears as though some potentially major activity may be witnessed with the return of the active regions to the eastern limb between 26 and 28 December. More will be known as these regions begin to return.

** End of Report **

>The AM system wins because the transmitter doesn't get hot and the receiver
>can be simpler. Fidelity is better, too. (This is all at the expense of
>twice the transmission bandwidth, of course.)

Conventional AM puts a minimum of 50% of the transmitted power in the nearly useless carrier and a maximum of 25% of the radiated power in a sideband with an equal amount in the redundant other sideband. During the frequent silent periods in speech the transmitter wastes 100% power in the unnecessary carrier. This is a very inefficient use of power even if the DC to RF conversion were 100% efficient. The IHF says that average speech only has a 12.5% duty cycle so an AM transmitter is automatically throwing away 87.5% of it's radiated power. Suppressed carrier modulation doesn't transmit any power during the silent periods. That's why the old Drake transmitters could claim 200 watts PEP with a pair of sweep tubes, each of which had 12.5 watts of plate dissipation.

The AM signal will suffer a 3 db penalty due to the wider receiver bandwidth allowing in twice as much noise energy. This doesn't even consider the fact that an AM envelope detector throws away another 3 db compared to the product detector used for SSB. However, if you use a coherent synchronous dectector and DSB suppressed carrier, you get a big win in signal to noise ratio. Noise is non-coherent and is strongly rejected by a coherent detector. As much as 12 db improvement over an equal power SSB signal is possible. About the only disadvantages of using DSB suppressed carrier with coherent detection are an increased susceptibility to selective fading and, of course, the consumption of twice the spectrum of SSB. With today's ICs it's relatively easy to build a top notch coherent DSB system.

As quoted from <1703@ke4zv.UUCP> by gary@ke4zv.UUCP (Gary Coffman):
+---------------
| I have some ideas about what's wrong with the hobby other than presumed
| archaic licensing requirements, but let's wait and see before starting
| another crusade.
+---------------

I have some opinions as to why most people aren't interested in ham radio as well --- I wouldn't call it problems with our hobby, though.

The simple fact is that it's "in" to hold and defend uninformed opinions while belittling those who *are* informed. Anti-intellectualism is still alive and well in the U.S. And ham radio is a *technical* hobby, public service notwithstanding. After all, the basis of our public service ability is that we are supposed to know enough to know how to assemble and/or manage working communications setups. This *does* include integrating non-amateur services like cellular, Part 15 radios on 49 MHz, and even CB when they're appropriate... it's the *know-how* that is our most important asset, regardless of where or how we apply it. Know-how that ranges from pure technical to organization and integration of communications to produce effective and efficient communications. I still count the latter as technical, because you have to have at least *some* understanding of the possibilities before you can make rational decisions on how to integrate it into a working communications system. This is especially important in emergencies, when the local hams might be the *only* ones who know how to take a hodge-podge of radio equipment and devise a working emergency communications network out of it.

The simple solve-it-from-within solution is to drop the theory as well as the code. THIS IS THE WRONG SOLUTION! It destroys our most important asset.

The problem, and therefore the solution, are *outside* amateur radio. It's the same problem faced by the technical industries in the U.S. right now and looming large over their futures: the general public needs to be made aware of the importance of technical skills and knowledge, to the point where the general public will push for improvements in education and for more college students to major in technical areas.

This is the *biggest* threat to amateur radio. Not code/nocode, not a sudden inrush of unruly "CBers", not the encroachment of commercial services on our bands. HAM RADIO IS UNPOPULAR BECAUSE UNDERSTANDING TECHNOLOGY IS UNPOPULAR. After all, how much do you need to know to operate a cellular phone or a Nintendo?

If there is one area that I would recommend be addressed by all radio amateurs as quickly as possible, it is this one. Because it's not just ham radio that

will go down the tubes if we don't....

lose

This is a minor nit to pick, and in no way as important as code vs. nocode wars... In the last year, I have noticed that there are gobs of people on usenet that don't know the difference between "loose" and "lose". For the last time:

loose - (loos) as in not tight.
lose - (looz) as in can't find anymore, or lost.

That done, please disregard, and return to the inane code vs nocode wars.

Chuck Harris - WA3UQV
chuck@eng.umd.edu

4617. 14313 kHz had indeed gone to the dogs

Newsgroup: rec.ham-radio
Date: 1990-12-23 22:06:04 UTC
From: 0003829147@mcimail.com
Message-ID: <1990Dec23.220604.2333@terminator.cc.umich.edu>
Source record: 5027

Intermingled with the messages pertaining to the continuing code/
no-code debate have been repeated references to what is going on
at 14313 kHz. At least two messages on Usenet expressed curiousity
about 14313, and I've been wondering about that frequency myself,
so I tuned it in today on my Sony ICF-2010.

I realize that many hams have listened to this first-hand. For the
benefit of those who haven't, however, this is what I found when I
turned on the radio today on 23 December 1990, beginning at 2045 UTC:

Time: Description:

2045* "You are a <homosexual epithet>" (no call sign, repeated
several times)
2050* "Is this frequency in use, pleeeeeeeez?" (no call sign,
repeated several times)
2057 "Bearcat 1 to Bearcat 2" (again, no call sign)
2058 DELIBERATE ATTEMPT TO JAM A LEGITIMATE QSO IN PROGRESS:
"Get off the air, <actual callsign>. Who the h*** do
you think you are?"
2059 "<Actual callsign> dog****, get off the frequency."
2101 Anti-semetic epithets heard at this time
2102 Morse code (jamming?). Also, someone is whistling into the
microphone.
2106 More epithets heard.
2108 Deliberate interference by moving microphone or breathing
into it.
2116 Deliberate jamming by chanting/singing into the
microphone.
2124 "Who gives a ****" (no call sign, regular intervals)
2128 Computer tones (AMTOR?) heard
2129 First reference to Herbie heard. More epithets heard.
2135 Best wishes and a Happy New Year (from someone who had
previously given his callsign). 8-)

(* Approximate time.)

As I type this, I've been looking at my copy of "Tune in the World",
and I may yet learn the code and get licensed in the traditional way.
But having said that, let me add this:

1) I have no problem with someone coming into Ham Radio through the
most recently developed route (i.e., the no-code Tech). I wish these
people the best of luck.

2) In no way does 14313 represent typical ham behavior. I have yet to hear another frequency that sounds even remotely like the one I had described above.

3) The presence or absence of the knowledge of morse code is not a prerequisite for acting like an idiot on the air. Given the behavior on 14313, I don't think we have any right to claim that the no-code license holders will contribute to the deterioration of ham radio. For as far as I can tell, at least as far as 14313 is concerned, that's happening already.

Best wishes for the holiday season.

Sander J. Rabinowitz | sjr@mcimail.com -or- | ARRL Associate Member
Farmington Hills, Mich. | !sander@attmail.com | 8-)

P.S. IMHO, only two or three stations were responsible for the mess I described above.

SAREX RELATED QRM INQUIRY

HR AMSAT NEWS SERVICE BULLETIN 349.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Information Needed On SAREX QRMing Of Terrestrial Operations on 144.950 MHz

After a highly successful Shuttle Amateur Radio Experiment (SAREX) on the
recent STS-35 ASTRO-1 mission, AMSAT-NA officials would like to assess the
effect this SAREX mission had on the users of packet radio DX clusters and
other services which use 144.950 MHz. During the flight of STS-35, WA4SIR's
packet station was set up to operate on the 2M split-frequency combination
of 145.550/144.950 MHz. This frequency arrangement was choosen so that
those with simple 2 meter FM packet stations with only 600 KHz split option
would still have a chance to make a contact and receive a QSL card from
WA4SIR. At the final "tally," this strategy seemed to have worked
well as over 1800 stations had made packet contact with WA4SIR.

But before the flight of STS-35 began, AMSAT-NA and ARRL officials became
aware of numerous protests in the amateur radio community to the use of
144.950 MHz for the uplink to SAREX. Subsequently, a set of guidelines and
suggested operating procedures were drawn up and published in the AMSAT News
Service (ANS) bulletins to help reduce the QRM on 144.950 MHz when STS-35 was
overhead. Now Doug Loughmiller (KO5I), AMSAT-NA President and General Manager
would like to hear from the "Sys Ops," users of packet DX clusters, and
other 144.950 occupants about any QRM problems they faced during the nine day
SAREX mission and how well the AMSAT guidelines were followed. Please send
your comments and observations to:
```

SB ALL @ AMSAT $ANS-349.02
MIR OPERATIONS UPDATE

HR AMSAT NEWS SERVICE BULLETIN 349.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Off to a Slow Start, but Expectations are High

Amateur Radio Operation from the Soviet Space Station MIR has been erratic since Musa, U2MIR, has been extremely busy tending to his duties aboard MIR. During a QSO with Hans, ZS6AKV, Musa apologized that he was very busy and didn't have much time for Amateur Radio right now. Musa did say that packet operation should commence soon after the launch of the Progress-M6 supply ship which will transport the packet experiment equipment. Progress is due for liftoff on 15 Jan from Baikonur and slated for docking on 17 Jan. Any slip in the launch of Progress will obviously delay the commencement of packet operations. It is expected that it will take a few days for Musa to complete the integration of the packet experiment with the existing 2 meter FM transceiver onboard.

Hopes for an expected QSO between Musa in MIR and Ron Parise in Columbia were dashed when the Shuttle orbiter was brought home a full day earlier than scheduled due to landing strip weather constraints. It is unclear at this time whether Musa will still be on MIR when the STS-37 Mission and its crew of FIVE Amateur Radio operators, who also happen to be astronauts, will be launched. The STS-37 launch is scheduled for the spring of 1991.

[ANS thanks Ed O'Grady, KE2VC, and Hans ZS6AKV for the information for this Bulletin]

SB ALL @ AMSAT $ANS-349.03
STS-35 SAREX A MAJOR SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 349.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

STS-35 SAREX Mission A Major Success; STS-37 To Carry Five Hams In May '91

Less than a week after the STS-35 SAREX mission AMSAT-NA officials are declaring the SAREX portion of the flight to be a major success. Over 1800 radio amateurs around the world were able to make a packet radio contact with WA4SIR. In addition to the fun generated by a "space-mobile" station, hundreds of elementry school children were thrilled by the chance to talk with Ron Parise and ask questions about life in space through amateur radio relay

stations in Australia and Brazil. For those who made a contact with WA4SIR and would like to receive a beautiful QSL card, send your QSL to ARRL HQ (225 Main Street, Newington, Ct, 06111) along with an S.A.S.E, ATTENTION: Education Activities Dept., and you will have a return QSL card on the way to you soon. Once the log of contacts has been retrieved by Johnson Space Center Amateur Radio Club (JSC ARC), the complete list of calls from the SAREX mission will be re-printed in the AMSAT Journal.

On the next scientific shuttle mission, STS-37, there will be FIVE licensed amateur operators aboard; the ENTIRE shuttle crew for this flight are hams! They are: Ken Cameron (KB5AWP), Jay Apt (N5QWL), Lynda Godwin (N5RAX), Steve Nagel (N5RAW), and Jerry Ross who recently passed his Novice exam but has not yet received his call. This SAREX mission will have an upgraded station which should include fast-scan ATV. ATV enthusiasts can look forward to uplinking their famous "ham-station" pictures to this flying "hamvention." Look for further information from the AMSAT News Service (ANS) as more information becomes available about STS-37.

SB ALL @ AMSAT $ANS-349.04
MIICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 349.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT Engineering Team issues Microsat Status dated 12/14/90

Not much happened this week, as business commitments (real jobs!) and Christmas shopping cut into the Microsat staff's available work hours. Several microsat controllers were away on trips; the spacecraft were being monitored properly, but the redundancy we like to have when uploading new software was not available.

All four spacecraft are in a stable condition, sending PHT telemetry. LO-19 and AO-16 are available for digipeating, and the WEBERSAT crew continues to experiment with attitude determination methods and iris settings. Several new test images are downlinked each week.

WO-18 seems to have at least two different stable spin modes, although the exact mechanism for changing from one to the other remains unclear. In the last several weeks, it has gone to a much slower spin rate than the rate it was spinning immediately after launch. This has reduced the number of times each day that the geometry between the camera and the earth is optimum for imaging. Part of the problem is in determining how to tell (using the horizon sensor and array currents) when the geometry IS right.

The AO-16 power management problem that cropped up early last week has been resolved, and the spacecraft is happily running its new algorithm.

The problems that took the AO-16 BBS out of service two weeks ago have been identified. Jeff Ward at Surrey has made some fixes and implemented the "last" major feature, UO-14 has been reloaded and is being tested. Harold

Price is fixing a problem with the AX.25 driver, and will reload AO-16 shortly.

Jeff Ward and Harold Price, the BBS developers, ask that users who are writing their own FTL0 interface programs refrain from mass distribution of those programs to others until they certify that the spacecraft software is ready. The easiest way to control access to the flight BBS during this last test phase is to have a small set of beta testers. You should feel free to continue your own testing with the live spacecraft, and report any problems you encounter. You will be able to release your software at the same time we release the spacecraft for general use. The current plan calls for this to occur around Dec 25. Merry Christmas!

[ANS thanks Harold Price, NK6K, for the information for this bulletin]

SB ALL @ AMSAT $ANS-349.05
WEBERSAT-OSCAR-18 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 349.05 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 (WO-18) Update From Weber State University: December 7, 1990

In the past week, a few new things have been learned about the performance of WO-18. First and foremost, the present rotation of the spacecraft about its Z-axis is one revolution approximately every 21 minutes. This is a drastically slower rate than what was expected before launch. There is as yet no explanation of why the rotation slowed from its immediate post-launch value of one revolution-per-minute (1 RPM). We are not convinced the present rate will be the final rotation profile of the spacecraft. Evidence is accumulating that a future reversal of rotation direction is not likely, i.e., the rotation rate is not slowing linearly. In fact, there has been little change in the Z-axis rotation rate in the last two weeks.

Despite the decreased rotation and its negative impact on low latitude photo opportunities, we have continued to attempt experiments with varied iris parameters during earth imaging. On a daily basis, we typically attempt about 6 to 7 photos (the number of equator crossings between day and night passes at WSU) of the Earth with different parameter adjustments.

Listeners in the U.S. may often hear transitions from one transmitted photo to the next as we examine the results of each experiment. When interesting photos are obtained, we will notify the user community through the usual media and leave that photo transmitting from WO-18 for several days.

We are continuing to process standard TLM and Whole Orbit Data (WOD) for a complete archive file. Reid Bristor is sending his AMSAT archived data to add to ours. We have added features to our decode program that provides plotting capability. If WO-18 users are interested in this program and other software we are working on in data analysis, we could spend some effort making these tools more user friendly and distribute them to users through the AMSAT-NA Software Exchange.

FCC CODELESS LICENSE ACTION

HR AMSAT NEWS SERVICE BULLETIN 349.06 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Morse Code Requirement Removed from FCC Technician Class Amateur License

In an action by the FCC on December 13, 1990, the Morse Code testing requirement for the Technician class amateur license was removed. This change in requirement could take effect as soon as February 1991.

Those obtaining Technician licenses after the rules change will have full amateur privileges above 30 MHz but will not be allowed to use the Novice/Technician allocations below 30 MHz unless they pass the 5 WPM code test now required of both Novices and Technicians. There will be no special callsign groups or other distinction between Technicians licensed for operation below 30 MHz and those "code free" Technicians restricted to VHF and above aside from FCC and VEC records.

The Novice license is unaffected by this action and existing Technician licensees will be "grandfathered" into the new system. The codeless Technician written examination will have 55 questions.

AMSAT, under the leadership of its Board of Directors, has been a supporter of the no-code concept although this ruling is somewhat different from the proposal and comments submitted officially by AMSAT. Many active satellite operators from Europe, Australia, and other countries are holders of no-code licenses similar to the type soon to become available in the U.S. due to this action. It is AMSAT's hope and desire that many new licensees who have previously found the universal Morse code requirement unsuited to their needs and tastes will be brought into the Amateur Radio Service and that many of these will be attracted into the Radio Amateur Satellite Service by the interesting technical and operational challenges inherent in our type of activity.

[ANS thanks W4RI and the ARRL for the information in this bulletin.]

SB ALL @ AMSAT $ANS-349.07
ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 349.07 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Schedule of ZRO Tests, Fall Edition

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

SB ALL @ AMSAT $ANS-349.08
OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 349.08 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

29 Dec 90 206 B 1500 KA5SMA WB9ANQ Saturday

05 Jan 91 214 B 1900 WD0E WA5ZIB Saturday
13 Jan 91 99 B 0500 WB6LLO N5BF Saturday
19 Jan 91 210 B 1445 WB9ANQ KA5SMA Saturday
26 Jan 91 211 B 1830 WA5ZIB WD0E Saturday

Jim White (WD0E) is scheduled to discuss Pacsat file server ground software operation with the net on 29 December 90. He and others on the pacsat test team will be available on nets through the Pacsat operational release period to assist new users.

John Champa (K8OCL), AMSAT-NA Executive VP will discuss AMSAT participation in advanced projects such as the World Space Foundation Solar Sail, Lunar Polar Prospector, and SEDSAT (supported by the Detroit Oscar User's Group) during the net session on 13 January 91.

Roy Welch (W0SL) will discuss his new job as AMSAT Software Exchange Manager and what this means in terms of improved software user support during the 26 January 91 session.

It is the intention of the Operations Net management to have guest speakers approximately every other week to provide up-to-the-minute information on

topics of interest (such as Microsat ground station software, AMSAT Software Exchange,and WARC 92). As guest speakers and topics are confirmed they will be published in ANS.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Consider moving some of your HF AMSAT Net sessions to the satellite or retransmitting nets from one to the other! Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-349.09
FALL AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 349.09 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140 <--- QRP on Mode B Please
Mode-B : MA 140 to MA 256
Omnis : MA 232 to MA 040

This schedule is expected to continue through 26 Dec 90.

Magnetorquing operation is expected to take place the week of 24 Dec 90. This operation takes place during the portion of the orbit closest to perigee (MA 000) and is done primarily to reorient the spacecraft for improved solar panel illumination. During magnetorquing, the transponders will be off (typically between MA 220 and MA 60. Once magnetorquing has been completed, a new Transponder Schedule will be published by the AO-13 Command Station Team and it will be published here in ANS.

The command team requests that you make a specific effort to use QRP on Mode B between MA 135 to 140. This is specifically to help those people experimenting with Mode S. (Although you really should always keep checking that your peak signal is never stronger than the beacon (145.813/435.651 MHz)

The spacecraft attitude of AO-13 is calculated to be:

BLON = 179.7 and BLAT = -3.3 for 17 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

BLON = 4.0 and BLAT = 0.0 for 15 December 90

=========

MONDAY DECEMBER 24, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* MIR NEWS *
============
U2MIR has once again become active from the Mir space station complex.
Musa Manarov, the Amateur Radio operator presently on board Mir has been
quite busy with his activities on the space station, so he hasn't had much
time to make many radio contacts. Packet radio operations are expected to
commence soon after Progress-M6 carries a packet radio TNC to Mir. The
launch of Progress-M6 is expected on 15-Jan-91, and docking will occur with
Mir on 17-Jan-91.

* DOVE NEWS *
=============
DOVE-1/OSCAR-17 still has not been reloaded with new software. After the
holidays, it is hoped that DOVE will be reset and reloaded with new operating
software that will allow the spacecraft to transmit messages consisting of
digitized speech.

* TNX QSL! *

UO-14 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 356.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

UoSAT-OSCAR-14 File Server Available for Access

After final testing of groundstation and spacecraft software by the beta
testers, the UO-14 File Server 'PBBS' is been released for general access.
Any suitably equipped stations are welcome to use the system. The UO-14
Engineering Team encourages users to report their early experiences of UO-14
BBS operations. They are particularly interested in hearing how you have
connected 9600 baud FSK modems to various radios.

UO-14 is currently broadcasting a file containing groundstation client software
for IBM-PC compatible computers; users who are already receiving the PACSAT
Broadcast Protocol transmissions can 'bootstrap' themselves simply by receiving
this broadcast. The file, number 791, is a .ZIP file containing PG.EXE and
associated documentation. This file will also be posted on Compuserve and will
migrate to other information sources. If you are not already using the PACSAT
Broadcast Protocol, make sure to get the PACSAT File Header utility programs
PFHADD.EXE and PHS.EXE as well as PG.EXE. The G0/K8KA groundstation software
works on both AO-16 and UO-14. As updated versions of the PACSAT Protocol
Suite are released, they will be carried as files on the satellites themselves
in the same way that file 791 is carried now. The AMSAT Software Exchange
is making copies available of this and other PACSAT related software via
```

AMSAT Headquarters.

You MUST have proper groundstation software before you can access the UO-14 or AO-16 file servers. The PACSAT Protocol Suite has been specified and widely published. At least two software authors (other than G0/K8KA) have used these specifications and written groundstation client software for the IBM; Implementations for other popular computers should follow in the New Year.

[ANS thanks Jeff W Ward, G0/K8KA for the information for this bulletin]

SB ALL @ AMSAT $ANS-356.02
MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 356.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Microsat Engineering Team Status Report as of 12/21/90

SUMMARY:

AO-16 - sending PHT telemetry, file system running for beta test.
DO-17 - sending PHT telemetry, no other changes.
WO-18 - sending PHT telemetry, dark image testing.
LO-19 - sending PHT telemetry, being reloaded.

FILE SYSTEM: We have again loaded what we hope is the final version of the first general release of the file system. UO-14 has also been reloaded. This latest reload was caused by a bug that was added while fixing several other bugs.

Jeff Ward, G0/K8KA, has also made some tweaks to the final version of the general release of PG. It is currently on UO-14, and we'll start it broadcasting from AO-16 this weekend. It will be compressed with ZIP. PB, the broadcast receiver, has been available on CIS for several weeks, and is available on several other BBS systems. The first version of PG was released on CIS and via UO-14 on 12/19/90.

UO-14 has already been released for general access. We want to do one more round of beta-tester access on AO-16 before exposing it to the masses. The previous bug was found quickly because each of the beta testers sent in their PG.LOG file which was matched to the post-mortem dump taken from AO-16. The next target for AO-16 release is Dec 24, provided there are no further problems.

If you get a copy of PG, do not try to use it on AO-16 until you see a specific message announcing that AO-16 is available for general use. You will need a special command in the PG.CFG file to access AO-16 and this command will not be documented until AO-16 is available for general use.

TELEMETRY: The diagnostic "wash" status message has been removed in this upload. The edac error counter now appears in the status message, in status[17]. This status cell was previously unused. We have done this to reduce the overhead on the downlink.

AO-16: The AO-16 BBS was restarted on 21 DEC 90 at 19:14 UTC. At this writing, it has survived three passes over the US with a reasonable load. WD0E, WB9ANQ, N4HY, and NK6K generated 290 activity log entries, activities like logon, logoff, directory, upload, and download. We will continue testing with a limited number of beta users, if all goes well, AO-16 should be open for general use in a few days. The more discriminating users will notice that the AO-16 downlink, when broadcasting, is different than it has been in the past. This version of the BBS uses only one buffer for the broadcast output queue, the previous version used three. That meant that, even during slow operations like an upload file close, when the entire file is scanned and the header checksum is computed, there were enough buffers for the DMA to keep the transmitter busy. With only one buffer, there will be occasional gaps for as much as a few seconds. The number of broadcast buffers may be increased in the next version, this version is an experiment to see how much free memory is available in the minimum configuration. Aside from causing the developer's hearts to miss a beat, the pauses are not a problem.

DO-17: Now that the AO-16 BBS software is stabilizing, attention is turning to DOVE. N4HY is to begin preparing a special loader for DOVE shortly.

WO-18: There have been no operational changes to WO-18 this week. The WEBERSAT command station has been downloading various dark side images this week to gather information on minor CCD defects which can be subtracted from normal images. They are also attempting to see if, with sufficient post-processing, stars can be discerned.

LO-19: LUSAT was reset to the ROM and rebooted early on 22 DEC 90 UTC in preparation for loading the BBS. The BBS code will be loaded from the LUSAT command station in Argentina. There is no announced date for general availability of the LO-19 BBS.

The following recommendations for TNC parameters are made for use with the AO-16 BBS.

Set FRACK to 6. Set MAXFRAME to 1.

These settings are compatible with the multi-user 1200 baud downlink.

ACTIVITY LOG: The following request is made by G0/K8KA for UO-14 and by NK6K for AO-16. Please do not download the activity log files (ALyymmdd). They are very large now, primarily for use in debugging, and several downloads per pass is inefficient. The previous day's AL file will be put in the broadcast rotation. A program to display the file will also be broadcast.

[ANS thanks Harold Price, NK6K, for the information for this bulletin]

BADR DECAYS

HR AMSAT NEWS SERVICE BULLETIN 356.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Pakistani 'Amateur' Satellite Re-enters Earth's Atmosphere.

A Pakistani satellite launched by the People's Republic of China earlier this year re-entered the Earth's Atmosphere either late on 8 December 90 or early on 9 December 90. The satellite, dubbed BADR, had an output frequency of 145.825 MHz, a frequency also used by UO-11 and DO-17. It was never quite understood why the Pakistani Government assigned the 145.825 MHz output frequency when there was no amateur transponder on-board or any published telemetry information which might have been of use to the Amateur Service.

Below is a beginning and ending snapshot of selected orbital paramaters of BADR

AMSAT BEGINNERS WORKSHOP

HR AMSAT NEWS SERVICE BULLETIN 356.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Tyler, TX ARC To Offer Beginner's Workshop On January 19, 1991

The Tyler, TX Amateur Radio Club will present an all day "hands-on" workshop to help acquaint beginners with the operation of all OSCARs flying today. Included in this workshop will be a discussion about Weather Satellites by Dallas Remote Imaging Group (DRIG) Chairman Jeff Walach (N5ITU). In addition to classroom discussions, there will be several OSCAR stations set up to allow as many attendees as possible the chance of using at least one OSCAR during the day. Stations will be available for use with AO-13, PACSATs, RS-10/11, RS-14/RUDAK-2, and for viewing weather satellite pictures.

After the workshop, there will be a dinner banquet with keynote speaker AMSAT-NA President and General Manager, Doug Loughmiller (KO5I). You are invited to join the Tyler ARC on January 19, 1991 at the Tyler, TX Junior College for this excellent event. For more information about registration and lodgings, contact KO5I at (903) 784-3740.

TEXAS BALLOON LAUNCH SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 356.05 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Texas Balloon Launch Dubbed a Great Success

The Huntsville Municipal Airport served as the setting for the launch of a hot air balloon carring an amateur radio payload at 10:46 local time on December 8, 1990. The launch team was composed entirely of AMSAT Members. The balloon lifted the payload (a two-meter telemetry beacon) to over 100,000 feet. Analog data (tones) for external temperature and altitude were transmitted using CW with the keying speed being set by internal temperature. The 200 mW beacon was placed on 147.435 MHz using the callsign WB5HLZ. External temperatures reached -70 degrees F. Internal temperatures never fell below 34 degrees F. The package transmitted flawlessly for the duration of the flight and was still transmitting 30 hours after launch.

Recovery was at 3:10 PM on December 9th when the package was found at the 70' level of a pine tree in a private game preserve in thick woods near Magnolia, TX. The cord above the package was parted "Texas style" by a .22 caliber bullet just above the swivel joint holding the package in the tree. The parachute was not recovered and the tree could not be climbed. Total ground distance traveled was 37 miles.

The group is contemplating either an ATV, a digipeater or a Mode J FM transponder payload for another launch sometime in the Spring of 1991.

[ANS thanks Andy MacAlister,WA5ZIB, for the information for this bulletin]

AMSAT QSL BUREAU INFO

HR AMSAT NEWS SERVICE BULLETIN 356.06 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT QSL BUREAU ALIVE & WELL; NEEDS YOUR QSL CARD & S.A.S.E.

WB8OTH wishes to remind all OSCAR satellite users that as Manager of the AMSAT QSL Bureau, he needs your SASE! Perry says that he has many QSL cards waiting for hams to receive but he can't forward them because of the lack of a envelopes from addresees. Perry adds that everyone who uses OSCARs, especially with the increase in DX activity seen on AO-13, should send him their outbound cards along with several SASEs so he can quickly turn around that rare DX QSL. Send your QSL cards and SASEs to following address:

AMSAT QSL BUREAU
1850 Lise Avenue
Obetz, OH

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 356.07 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

29 Dec 90 206 B 1500 KA5SMA WB9ANQ Saturday

05 Jan 91 214 B 1900 WD0E WA5ZIB Saturday
13 Jan 91 99 B 0500 WB6LLO N5BF Saturday
19 Jan 91 210 B 1445 WB9ANQ KA5SMA Saturday
26 Jan 91 211 B 1830 WA5ZIB WD0E Saturday

Jim White (WD0E) is scheduled to discuss Pacsat file server ground software operation with the net on 29 December 90. He and others on the pacsat test team will be available on nets through the Pacsat operational release period to assist new users.

John Champa (K8OCL), AMSAT-NA Executive VP will discuss AMSAT participation in advanced projects such as the World Space Foundation Solar Sail, Lunar Polar Prospector, and SEDSAT (supported by the Detroit Oscar User's Group) during the net session on 13 January 91.

Roy Welch (W0SL) will discuss his new job as AMSAT Software Exchange Manager and what this means in terms of improved software user support during the 26 January 91 session.

It is the intention of the Operations Net management to have guest speakers approximately every other week to provide up-to-the-minute information on topics of interest (such as Microsat ground station software, AMSAT Software Exchange,and WARC 92). As guest speakers and topics are confirmed they will be published in ANS.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Consider moving some of your HF AMSAT Net sessions to the satellite or retransmitting nets from one to the other! Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-356.08
NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 356.08 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

The new winter transponder schedule for AO-13 is as follows:

```
Mode-B : MA 0 to MA 165 | <= IF eclipses over-drain battery in
Mode-JL: MA 165 to mA 190 | Jan 10 - Feb 06, B-OFFs MA 20-65
Mode-LS: MA 190 to MA 195 |
Mode-S : MA 195 to MA 200 | <= Mode B is OFF; no swishing!
Mode-BS: MA 200 to MA 205 | <= QRP on BS please. High power
Mode-B : MA 205 to MA 256 | wipes out mode S experimenters.
Omnis : MA 240 to MA 30 |
```

This schedule is expected to span from 28 December 90 to 25 March 91

The command team requests that you make a specific effort to use QRP on Mode B between MA 200 to 205. This is specifically to help those people who are experimenting with Mode S.

Magnetorquing operation is expected to take place during the week of 24 Dec 90. This operation takes place during the portion of the orbit closest to perigee (MA 000) and is done primarily to reorient the spacecraft for improved solar panel illumination. During magnetorquing, the transponders will be off (typically between MA 220 and MA 60).

During the Winter, the worst Sun angle (11 March 91) will be -27 deg, resulting in 89% illumination. AO-13 will experience eclipses by the Earth from 11 January 91 to 6 February 91, the longest being 82 minutes (MA 32-53). If battery drain is excessive during this period of time, it may result is Mode B being turned off during MA 20-65 until 6 February 91. AO-13 will experience Lunar eclipses on 16 March 91 (50%) and 14 April 91 (23%).

Once magnetorquing operations have been completed, the spacecraft attitude of AO-13 is expected to be:

BLON = 210.0 and BLAT = 0.0 for 31 December 90
Spin Rate should be brought up to 30 RPM from the present 27.6 RPM

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

BLON = 2.0 and BLAT = 0.0 for 29 December 90

/EX

4625. Re: 14313 kHz had indeed gone to the dogs

Newsgroup: rec.ham-radio
Date: 1990-12-24 01:48:51 UTC
From: mcovingt@athena.cs.uga.edu
Message-ID: <1990Dec24.014851.8801@athena.cs.uga.edu>
Source record: 5030

OK folks, let's make an organized effort to do some direction finding on 14313. If people would compile logs like you just did -- with the beam heading for each signal and the approximate signal strength -- then it would be fairly easy for the Official Observers (chez ARRL) to "reduce the observations" into some quite clean data about who the obnoxious operators are.

I don't have a rotatable antenna, so there's not much I can do, but all the people with directional antennas could accomplish a lot.

This is similar to observational astronomy projects I've been involved with, such as locating meteorites. A large number of relatively unsophisticated observations can be very valuable. Exact times are needed.

>of plate dissipation.

You can reduce the carrier level during quiet periods to accomplish the
same thing with AM. National Semiconductor used to have a modulator circuit
in their Linear Applications Handbook that worked this way. (I don't
remember whether it was a switching or linear modulator.)

>
>The AM signal will suffer a 3 db penalty due to the wider receiver bandwidth
>allowing in twice as much noise energy. This doesn't even consider

You're right about this...

>the fact that an AM envelope detector throws away another 3 db compared to
>the product detector used for SSB.

...but the final S/N ratio is determined by the front end and IF filters,
pretty much independent of the detection scheme if we are above threshold.

>However, if you use a coherent synchronous
>dectector and DSB suppressed carrier, you get a big win in signal to noise
>ratio. Noise is non-coherent and is strongly rejected by a coherent detector.
>As much as 12 db improvement over an equal power SSB signal is possible.
>About the only disadvantages of using DSB suppressed carrier with coherent

>detection are an increased susceptibility to selective fading and, of course,
>the consumption of twice the spectrum of SSB. With today's ICs it's relatively
>easy to build a top notch coherent DSB system.

Consideration of SNR as a function of DC input is pretty much an obsolete concept unless there are stringent heat dissipation considerations, like for example a "cubic incher" type transmitter. You have the choice of throwing half your power away as heat or throwing half your power away as useless carrier. If we had an 80 or 90 percent efficient SSB transmitter (maybe with some sort of high level modulator) it would be another story. Any ideas?

On Decemer 13th, the FCC modified the requirements for the Technician Class license with a code test. This bold move offers great hope to all of us who are deeply concerned with the possibility that amateur radio will one day soon be crushed under the weight of the spectrum needs of other services.

I was disturbed to note, however, that you were reported to be considering asking the FCC to reconsider this action to the extent of confining the new codeless Technicians to 222 mhz and up. I consider this most unwise for the following reasons:

One basic Technician Class license with one written exam + a CW endorsement for those who want to operate on HF would be easier and cheaper for the FCC to administer.

"Ghetto-izing" the codefree Technician Class licensees provides no regulatory or technological benefit. Rather, it serves only to codify social discrimination by preventing the newcomers from coming into contact with the majority of their fellow amateur operators.

Amateur radio constitutes the United States' first National Park of the Mind, and broad, open access to that public resource will provide intellectually stimulating and spiritually refreshing benefits to the nation that narrow, inhibitory access by the privileged few cannot. I believe that that is the basic reason the FCC made its decision.

Amateur radio's greatest contributions to the state of the art occurred during the period of its early history when it was not straight-jacketed by complex regulations and licensing structures not based on compelling need. Preventing or inhibiting the freest possible exploration of the National Park of the Mind consistent with conserving its meaningful existence would tend toward reducing it to the site for historical tableaux similar to those re-enactments of medieval jousting.

There is no compelling need for creating your proposed codefree ghetto. Therefore, any request for reconsideration will doubtlessly be rejected out of hand. The only result of a Petition for Reconsideration will be to make the League look foolish.

Moreover, since the new codefree amateurs are going to revitalize the future of ham radio, resentment against the organization that attempted to cause part of the original promise to be withdrawn would no doubt result in very few of them joining the League, which would very likely become little more than the custodians for its Antique Wireless Museum.

To summarize, it's a dumb idea.

Er... that's not how it works.
"who" refers to people only;
"which" refers to non-people only;
"that" refers to either kind.

The FCC *does* regulate receivers, but only the ones that are marketed commercially. They have two concerns:

(1) Emissions from the local oscillator;

(2) Fair coverage of broadcast bands and other frequency bands. For example, all CBs, even if receive-only, must have (or be able to be crystalled for) all 40 channels. All TV sets must have both VHF and UHF with comparable performance and ease of use on all the channels.

This is to prevent broadcasters on some TV channels from being at a competitive disadvantage. Likewise, AM radios have to cover the whole AM band; FM radios have to cover the whole FM band, and so forth.

4631. MAJOR SOLAR FLARE ALERT (23 DECEMBER)

Newsgroup: rec.ham-radio
Date: 1990-12-24 09:09:22 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901224020922.23801fb7@HG.ULeth.CA>
Source record: 5041

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 23, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Another significantly powerful solar flare blasted off the western limb today from Region 6412, which up until now has produced relatively little flare activity despite its magnetic complexity. This flare was rated a class X1.0/2B Tenflare which produced major radio emissions at 245 MHz which peaked at levels of near 18,000 s.f.u.. This flare was associated with a major Type II radio sweep frequency event, but was not apparently associated with a Type IV event. A satellite-level proton enhancement was observed at 10:05 UT on 23 December and reached an unofficial peak of 5 PFU (particle flux units) at 11:40 UT on 23 December. The proton levels have been decaying since that time and are now at near background levels. The flare was located at N11W68 and lasted 40 minutes. It began at 09:33 UT, reached a peak x-ray intensity of X1.0 at 09:52 UT and ended at 10:13 UT on 23 December. It was also associated with a significant SID/SWF whose duration unofficially lasted approximately 50 to 70 minutes over sunlit portions of the earth.

This major flare is the first X-class flare to occur since 27 August of this year, when a short-duration class X3/2B flare erupted near the central meridian and produced a minor to major geomagnetic storm approximately three days later. However, unlike August's event, this flare is not expected to have a serious terrestrial impact (see below).

Region 6420, which produced the major flare of 22 December, has been separated into two separate active regions due to its extensive elongated spot complex. The new region has been numbered 6423. Region 6423 is the less active of the these two parts. Region 6420 is still capable of producing M-class flare activity, although major activity from this region is not currently anticipated. There is, however, a slight risk of a major flare recurring from Region 6420 over the coming days.

Region 6412 is the area being closely watched at the present time. Until it rotates beyond the western limb on 24 December, this region will remain capable of producing another major energetic flare capable of influencing the terrestrial environment. The probability for major flaring will decrease on 25 and 26 December as this region disappears beyond the western limb. This will be the second time Region 6412 has disappeared

beyond the western limb. On it's previous rotation, when the region was numbered 6368, it produced only a single major flare and numerous M-class events. There is a significant possibility that this region will again return to the eastern limb near 7 December. Preliminary analysis of models suggest that if this region persists through to its third appearance on the eastern limb, the potential for major proton flaring will become elevated. These predictions are far from conclusive, however. Yet, it is an interesting side-note. More will be known when models are more extensively consulted over the next week.

POTENTIAL TERRESTRIAL IMPACT FORECAST

Today's major class X1.0/2B major flare may have a slight terrestrial impact anywhere from about 22:00 UT on 25 December to 24:00 UT on 26 December. Geomagnetic activity may become slightly enhanced between 25 to 27 December due to this flare. However, if any activity does materialize, it is not expected to be too significant. Geomagnetic activity should remain near unsettled levels on these days, except for active periods which may be observed over high latitudes. There is a slight risk that magnetic coupling with a possible shockwave from this flare may produce active to minor storm levels. Although this risk is small, it should be noted incase this scenario proves more accurate than the one presently being relied on. Recurrent coronal-induced activity is expected to increase on 27 December, which may combine with any flare-related effects to produce higher than expected magnetic activity. For the moment, however, flare-effects are expected to be low. Recurrent geomagnetic activity will likely dominate, with only unsettled levels being witnessed over low and middle latitudes, while high latitudes may attain active levels.

** End of Report **

4632. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-12-24 09:14:48 UTC

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
December 23 to January 01, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 16 DECEMBER TO 22 DECEMBER.

Solar activity this week has been mostly moderate. Regions 6412 and 6415 were predominantly responsible for the activity early in the week. By mid-week, a new active region rotated into view (labelled Region 6420). This region has produced several M-class flares and also spawned one major energetic event. The major flare occurred at 22:46 UT on 22 December. This event reached a class M5.3 x-ray level and was optically classified as a type 2B flare (moderate in size and brilliant). However, it was not accompanied by any significant radio bursts or sweep frequency events.

Another major energetic event of greater significance was the class X1.0/2B major Tenflare which occurred from departing Region 6412. This region was associated with an intense 245 MHz radio burst of 18,000 s.f.u.. It was also accompanied by a major Type II radio sweep. This flare was located at N11W68 and lasted 40 minutes. Terrestrial impacts from this flare included a strong SID/SWF and a satellite-level proton enhancement. Any geophysical activity occurring as a result of this flare will be reported in next weeks STFR report.

The largest region on the disk was Region 6412 (which was the mammoth sized Region 6368 on it's last rotation), which maintained a respectable size of about 3,600 million square kilometers (1,400 million square miles). This region gradually became increasingly complex in it's magnetic and optical characteristics, attaining a type Beta-Gamma magnetic configuration by mid-week. It maintained this configuration and it's size throughout the remainder of the week. It will rotate beyond the west limb on 24 December. Although this region may change configuration rapidly if flaring continues on the far side of the sun, there is still a relatively high probability that this region will return again near 7-8 January.

Region 6415 became quite active early in the week during its growth period. It attained a size of about 1,300 million square kilometers (520 million square miles) and managed to spawn numerous M-class flares. As the week progressed, this region began to decay and flaring decreased. By the end of the week, just prior to its disappearance beyond the west limb, this region spawned a class M4.3/1N flare at 23:21 UT on 22 December which was

associated Type II and Type IV sweep frequency events.

The number of M-class and C-class flares which occurred this week produced a significant number of SID's/SWF's. Distortion, aborption, noise and fading were all quite noticable during the daylight hours, particularly over the low and middle latitudes. Average SID durations were around 40 minutes, with between about 1 and 3 SID's occuring daily throughout this week.

Geomagnetic and auroral activity was dormant this week. No significant periods of auroral or geomagnetic activity were reported. The average planetary magnetic A-index figure this week was 5, which is significantly lower than the "normal" for activity this year. The earth is currently traversing the solar neutral sheet boundary, which is generally more magnetically stable than regions to the north or south of this boundary. Combined with a lack of coronal-induced corpuscular emissions, geomagnetic activity has remained relatively quiet.

Radio propagation conditions this week have been normal to above normal throughout the week, excluding the occasional SID-related SWF's which hampered HF communications. VHF communications were normal this week, with a few instances where SID-enhancements provided brief periods of favorable DX conditions. No auroral backscatter was possible this week.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Recent trends indicate that global solar activity has increased. Moreover, it appears as though two active solar longitudes have redeveloped separated by about 150 to 180 degrees, which is characteristic for the active sun during sunspot maximum. Almost all of the solar indices confirm this. The activity is expected to peak either early in January or February, followed by another decline to more stable conditions in March through to about June, 1991. If the models prove correct, the rotation of the previously active longitudes near 26 to 28 December may herald several weeks of increased major and M-class flaring. There is also an elevated risk for solar-induced geophysical impacts in January and/or February. The coming week will be the deciding factor on whether or not activity levels will peak in January or possibly in February.

This activity seems to conform well with the models which are predicting a surge of activity early next year, perhaps even into February. Activity is expected to increase notably with the return of Region 6397 (as well as all of the other regions which formed within the same longitudinal zone during the last rotation). These regions are expected to begin returning anytime now, but a particular surge in the solar flux is expected between near 26 to 28 December. Combined with Region 6420 (which was split into two separate active regions on 23 December - the new region is numbered 6423), which has produced one major flare already, overall flare activity is expected to increase. Solar activity should remain moderate with at least one M-class flare occurring per day. The risk for major flaring will become elevated as the active longitudes near 26-28 December rotate back into view.

Recurrent geomagnetic activity is expected to increase magnetic indices to quiet to unsettled levels by 24 or 25 December. Activity is not expected to be significant, however, provided flare-related shockwaves do not contribute to the activity. High latitudes may experience periods of active conditions while middle and low latitudes should remain mostly quiet to unsettled, becoming mostly unsettled by 25 December. Conditions throughout most of the coming week should be mostly quiet to unsettled, excluding any flare-related activity. For flare-related activity, consult the flare alerts when they are issued.

Auroral activity will become slightly enhanced at high latitudes this week, but no significant periods of activity are anticipated unless major flaring contributes to the activity, which will be covered in any major flare alerts which are posted. Middle latitudes will be hard-pressed to observe the relatively low auroral activity this week, due to lunar phase.

HF and VHF radio propagation should be normal to above normal this week, with similar levels of noise and daytime absorption occurring over the middle and low latitudes due to solar activity. The solar flux, sunspot number and background x-ray indices are all expected to begin increasing this week. It is presently difficult to predict the solar flux values which might be achieved, although present models suggest that the solar flux might reach levels as high as 260 (or perhaps higher). Sunspot numbers may break 250 by mid to late week. The increased ionizing solar radiation should provide very good opportunities for HF DX this week, provided geomagnetic activity remains at quiet to unsettled levels. VHF communications will experience brief periods of enhanced E-layer ionization due to flare activity that may significantly contribute to the potential for DX. There is a significant possibility for openings on 6 meters this week (particularly later in the week). MUF's will increase this week to levels near or above 50 MHz over many locations, particularly over the mid to low latitudes. Unless flare-related events contribute to terrestrial activity, no significant periods of auroral backscatter are expected this week on the VHF bands.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 23 DECEMBER

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca.

| Geomagnetic Field |Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun|Mon|Tue| Anomaly |
| Conditions | Given in 8-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

Cumulative 60 day Solar Activity Record
Start Date: October 25, 1990

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

4633. Re: Codeless Tech License

Newsgroup: rec.ham-radio
Date: 1990-12-24 16:14:35 UTC
From: pbhx@ellis.uchicago.edu
Message-ID: <1990Dec24.161435.9304@midway.uchicago.edu>
Source record: 5043

In article <47@bootsie.UUCP> olson@bootsie.UUCP (Eric Olson) writes:
>(prefaced by a deleted section in which he states he will go for a no-code
>license while he recognizes there is interesting stuff below 30 Mhz)....
> Anyway, I've pretty much decided that 5WPM is trivial, and once I've
> got equipment tempting me to operate <30MHz I'll probably _upgrade_
> to Novice (so to speak)

I believe this will happen to a good number who get no-code. After
they have talked to the same people over and over on the UHF and VHF
repeaters and have mastered packet radio (if one ever does), then
hearing of the HF contacts their friends have made, many will be
motivated to learn the code.

The problem with the code requirement before "no-code" was that some
opted out of ham radio before they ever got their license, as a result
of problems real or perceived with learning the code.

(I was one; in the mid 70s I tried for nearly a year to learn the code
but couldn't as I have a mild form of dyslexia. However, about 18
months ago I learned of the Code-Quick (tm) method and was able to get
from 5 wpm to 20 in about a year.)

Sure, there will be plenty who stay above 30Mhz, just as there are
many who now never go above the HF bands, but as a card-carrying
social scientist, I would love to see statistics 5 years from now on
the no-code licensees to see how many and for what reasons they added
code to their qualifications.

Yes, a certificate of sucessful completion for element 2 or 3A
signed by a VE can be used when requesting a VEC examing group
to submit a competed form 610 on your behalf.

Amen, brother! I think the most effective way to improve one's grasp
of theory is learning by doing rather than a complex set of examination
hurdles to jump, but theory, and more important the ability to put theory
to practical use, is vital to amateur radio.

>The problem, and therefore the solution, are *outside* amateur radio. It's

>If there is one area that I would recommend be addressed by all radio amateurs
>as quickly as possible, it is this one. Because it's not just ham radio that
>will go down the tubes if we don't....

You are right of course, but there is something we can do *with* amateur radio to change the situation. We can use amateur radio as bait to hook some of the young proto-technoids and get them interested in learning about technology for the fun of it before they lose their sense of wonder. If we're reasonably clever, we can be part of the solution instead of part of the problem. I believe that the ARRL is heading in the wrong direction with it's program to entice retired people into amateur radio. Instead, we should be working on the grassroots level to get amateur radio back in the classroom. Two of our local clubs are sponsoring amateur radio stations in middle schools. My packet club has purchased and donated packet equipment for one of the schools. Some of our members donate their time helping science teachers bring the wonder of electronics alive for these kids. And it's working! We've got a bunch of new Novices, several Techs, a few Generals, and even one Advanced class kid out of the effort so far. The biggest challenge by far is to welcome these kids into our clubs, to include them in our activities, to let them become leaders. I know it hurts old men's egos to see smart young kids pass you by, but that's what it's going to take to revitalize amateur radio and our country's technical ranks.

Right and wrong, I believe. Yes, he has to start over, but there is
a 2-year grace period. (Not that this extra year will help *him.*)

4638. A New Problem

Newsgroup: rec.ham-radio
Date: 1990-12-24 18:00:20 UTC
From: faunt@CISCO.COM
Message-ID: <9012241800.AA10864@ucsd.edu>
Source record: 5047

At least a few of us believe that some of the people we come in
contact with in public service work will now get their ham licenses in
order to do that kind of activity, and in that context, limiting them
to 220 and above would be a dis-service to the community as a whole,
because of the existence of a large existing public service
infra=structure.
I am in touch with a couple of my local EC's, and will try to get them
to push on the ARRL from their angle to get this objection by the ARRL
to the current no code Technician privileges dropped.

Right! One of the biggest sources of new hams, at least at first, will be families of present hams. These people's main contribution will probably be public service. (Additional operators for existing stations, etc.) And, at least where I am, public service (in the local area) relies on the 2-meter band to the exclusion of any other.

4640. The Amateur Radio BBS - UPDATE

Newsgroup: rec.ham-radio
Date: 1990-12-24 20:05:53 UTC
From: howardl@wb3ffv.ampr.org
Message-ID: <3808@wb3ffv.ampr.org>
Source record: 5057

```
+---------------------------------------------------------------------------+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.128.1 {wb3ffv.ampr.org} [for FTP access on 145.650 mhz ONLY]
Misc. Info: Machine is an 80486 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.09)
AA4RE BBS for the PC (Version 2.10)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
```

W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

H A P P Y H O L I D A Y S !!

4641. Merry Christmas to the Middle East - Help Needed

Hello to ANY/ALL

My New Sister in Law tells me she can not even send a Christmas Card
to my Brother which was only married 2 weeks before being sent to
"Place Unknown" If it is possible for you to come across him without
to much trouble could you tell him that we miss him, and would like to
say Merry Christams. His unit is one of those that moves so much they
do not even assign them a APO number. He is supose to be stationed
anywhere from East Coast USA to Europe to Mid-East. Subject to Change
without notice.

INFO:
Tech Sgt. Brian D. BUHNERKEMPE
C-5's out of Travis CA USA
301 st MAS

FLAMES:
Feel free to send them. Just send a X-Mass card to the
Mid-East at the same time.

William

> Hi. A quick question about Chebychev low pass filters. The ARRL Handbook
> says that the passband SWR depends on the passband ripple (bigger ripple,
> bigger SWR). My intuition tells me that that would only become a problem
> if you actually used the filter all over the passband; SOMEWHERE in the
> passband the high SWR would occur. If I'm running at a single, crystal
> defined frequency, can't I tune my antenna for good SWR regardless of my
> filter?
>

If you are going to stick to one frequency, a Chebyshev is the wrong thing
to use. Put all the poles on the frequency you intend to use. In other
words, put a `bunch of copies' of your series resonant Hi-Q circuit. This
approach maximizes your out of band rejection. You only want to use
complicated pole/zero structures if the filter needs to work over a broader
band.

Inductors and Capacitors are never perfect. They can and do burn a few
ergs of energy in their internal resistance.

Bob

4643. MONTHLY SOLAR TERRESTRIAL REVIEW AND SOLAR CYCLE OUTLOOK

Newsgroup: rec.ham-radio
Date: 1990-12-24 22:43:20 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901224154320.23801fb4@HG.ULeth.CA>
Source record: 5053

--- MONTHLY SOLAR TERRESTRIAL REVIEW ---
November 1990

Report Issued In-Part from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK DECEMBER 1990 - JUNE 1991

We are now in month 51 of solar cycle 22. Activity levels increased in November over October values, however, solar indices were nearly the same for the two months. This adds more support to maintaining July 1989 as solar maximum of cycle 22. Although prediction models are indicating an increase in activity and solar indices at the beginning of 1991, the models remain confident that July 1989 was solar maximum. The daily sunspot number actually fell in November, although the daily sunspot area increased. This phenomenon was due in large part to the unexpected growth of Region 6368 to mammoth proportions. This region finally became the second largest region of this solar cycle, surpassed only by Region 5395 of March 1989, which produced exceedingly severe solar flares during its transit on the solar disk. However, unlike Region 5395, Region 6368 failed to produce sustained high levels of activity.

Region 6368 did produce the only major flare of the month. It was an M7/1N flare at 23:17 UT on 26 November as the region was rotating over the west limb. Region 6368 also accounted for at least 14 of the 25 M-class flares detected during the month. Three of the 25 M-class flares were uncorrelated and may have been attributable to this region also.

There was a very slight proton enhancement at satellite altitudes beginning at 06:05 UT on 11 November which lasted about six hours. Protons were detected above background levels several times during this period, but never came close to event levels. The most likely cause of this enhancement was the M2/SF flare at 04:36 UT on 11 November from Region 6361.

The geomagnetic field was mostly quiet during the month of November with the following exceptions: On 16-17 November, high latitudes reported minor storm conditions while middle latitudes experienced active to unsettled conditions. The disappearance of a 19 degree segment of filament on 13 November is believed to be responsible. Then on 27 November, high latitudes experienced major storm conditions and middle latitudes experienced minor storm conditions. A sudden magnetic impulse of 21 nanoteslas was measured at Boulder Colorado at 23:32 UT on 26 November, preceding the magnetic storm of

27 November. The solar wind managed to compress the magnetopause inward past geosynchronous altitudes. GOES satellites reported magnetopause crossings beginning at 15:55 UT on 27 November. Disappearing filaments or several M-class flares that erupted in the proper time frame are possible causes of this activity.

SIX MONTH SOLAR CYCLE OUTLOOK

Solar prediction models are still suggesting an increase in solar activity early in January or February of 1991. Preliminary analysis of activity during December has verified that activity levels have increased at least during December. Activity is expected to continue to increase, reaching a peak in January or February, followed by a decline to more quiet conditions until near June or July of 1991. Major flaring has increased dramatically during December. Models indicate a slight risk of at least one major proton flare occuring during the next pulse of activity. Although no proton flares have yet been observed during December, models still indicate a potential for proton flaring, particularly between approximately 7 January and 21 January.

Geomagnetic activity is expected to be higher in January than it has been so far in December. Monthly magnetic indices are expected to peak between February and April. Preliminary estimates indicate a potential planetary average A-index of near 23 between February and April, 1991.

Auroral activity could peak in January or February, depending on how intense the pulse of solar activity becomes during these months. If solar activity is below the levels expected for these months, auroral activity will probably peak in March. Models indicate a slight risk for a major auroral storm sometime in January or February, caused by potential major flaring. If the storm materializes as models suggest it might, auroral activity may become visible over low latitudes. However, this activity is strongly dependent on the intensity of major flaring. The models are not in full agreement with regards to the intensity of major flaring which might occur during these months. Hence, some reservations are being made with regards to the accuracy of the models.

HF radio propagation conditions are expected to be relatively good during January and February, except for periods of geomagnetic storming which is expected to significantly hamper attempts at HF DX communications. The number of M-class flares is predicted to produce fairly frequent daytime HF signal absorption, distortion and potential periods of near blackout conditions during potentially intense solar flares. However, MUF's will be enhanced due to the increased solar activity, which will permit very good DX opportunities on frequencies above 30 MHz. Night-time propagation conditions are expected to vary from very good to very poor. During periods of quiet geomagnetic activity, night-time propagation conditions are expected to be very good, with sufficient F-layer ionization to permit good DX possibilities on higher HF bands. However, fading and signal flutter will dominate the higher latitude paths. During periods of potentially strong geomagnetic activity, propagation conditions will deteriorate significantly over most latitudes. High latitudes may experience severe flutter and absorption

during these periods. But overall average conditions during January and February should be relatively good.

VHF radio propagation conditions are expected to be normal to above normal in January and February. Frequencies near the 6 meter wavelengths are expected to be particularly enhanced during early January and possibly February as well. Openings above 50 MHz are anticipated during the early part of 1991, due to the increased ionization and enhanced MUF's. There is a good chance for auroral backscatter communications on all VHF bands during magnetic storm periods. If the intensity of magnetic storming materializes, widespread VHF auroral backscatter communications may become possible over high and middle latitudes, with a slight possibility for low-latitude auroral backscatter as well. Conditions should then fall to normal or slightly below normal levels from March until about June or July 1991.

NOTES:

- Xray Flare Classes (weak to strong): C, M, X (with sub-categories rated from 0.0 to 9.9 in each class).

- Optical Flare Classes (weak to strong): S, 1, 2, 3, 4 (with an attached figure identifying brightness: F-Faint, N-Normal, B-Brilliant).

- Locations are given in latitude and longitude as measured from the central solar meridian.

- Sweep Frequency Intensity represents the intensity of detected solar radio frequency bursts (bursts sweep over large frequencies). Type II and IV almost always represent ejection of solar material through the solar corona and into interplanetary space. Intensities are rated from 1 to 3+.

A friend interested in the codefree tech asked me if I could find him a program for programmed instruction in the theory elements of the test (as opposed to sample tests). He uses a clone under MS-DOS 3.21.

Hello Dan,

There is a packet BBS running out of the American Embassy in Saudi Arabia
using the callsign 7Z1AB. The BBS is intended for handling mail only traffic
for deployed U.S. military personel stationed in the Gulf region.
If you're intentions are to pass traffic through the net, you can E-mail
a note to Jim Stone - who set up the link, explaining how much traffic
will be passed and work out the logistics.
the E-Mail address for Jim Stone is:

"Jim%taueng.bitnet@mitvma.mit.edu"

Good luck
es 73,
Rich

No, they didn't. They probably told you that if you can't distinguish
between "who" and "whom" you can do without "whom" and just use "who".

But the distinction is easy to make. It's exactly the same as the
distinction between "he" and "him".

4648. Ham Radio Phone BBS List 1/91

Newsgroup: rec.ham-radio
Date: 1990-12-25 05:24:00 UTC
From: Thomas_W._Brown@f170.n771.z3.fidonet.org
Message-ID: <9012260835.AA21935@f170.n771.z3.fidonet.org>
Source record: 5065

From: TWB0@NS.CC.LEHIGH.EDU (Thomas W. Brown)
Lines: 478
Organization: The Internet

The following is a list of some telephone BBSs that support Amateur Radio.
Some of these are strictly for hams, while others support "SIG's" (special
interest groups) for hams or have radio-related files or message sections.

Disclaimer: Due to the increasing size of the list, it will only be
distributed on the packet networks once or twice each year as a
multipart bulletin. Some SysOps consider even the split-up messages
to be an overwhelming burden to the network and will inevitably
block them, so if you do not receive it via packet, you should
download the file HAMPHONE.91 from the Ham Radio archive section
of SIMTEL20 (wsmr-simtel20.army.mil on Internet), from the K4NGC
phone BBS at (703) 680-5970, or from the WB2COY phone BBS at
(914) 485-3393.

If you call one of these BBS's and find nothing to indicate it's
relationshipto Ham Radio or find that it has been disconnected, let me know
so I can
archive it and clean up the list. I can't gaurantee the accuracy of this
list,
but I do strive to keep it as up-to-date as possible. Please send any
updates,
changes, or comments to me. 73, Tom Brown KA2UGQ.

4649. Ham Radio Phone BBS List 1/91

Newsgroup: rec.ham-radio
Date: 1990-12-25 05:24:26 UTC
From: TWB0@NS.CC.LEHIGH.EDU
Message-ID: <9012250526.AA00181@ucsd.edu>
Source record: 5058

The following is a list of some telephone BBSs that support Amateur Radio.
Some of these are strictly for hams, while others support "SIG's" (special
interest groups) for hams or have radio-related files or message sections.

Disclaimer: Due to the increasing size of the list, it will only be
distributed on the packet networks once or twice each year as a
multipart bulletin. Some SysOps consider even the split-up messages
to be an overwhelming burden to the network and will inevitably
block them, so if you do not receive it via packet, you should
download the file HAMPHONE.91 from the Ham Radio archive section
of SIMTEL20 (wsmr-simtel20.army.mil on Internet), from the K4NGC
phone BBS at (703) 680-5970, or from the WB2COY phone BBS at
(914) 485-3393.

If you call one of these BBS's and find nothing to indicate it's relationship
to Ham Radio or find that it has been disconnected, let me know so I can
archive it and clean up the list. I can't gaurantee the accuracy of this list,
but I do strive to keep it as up-to-date as possible. Please send any updates,
changes, or comments to me. 73, Tom Brown KA2UGQ.

Packet: KA2UGQ @ KA2UGQ.NJ.USA.NA
ARPA: twb0@ns.cc.Lehigh.EDU

4650. National Museum of Communications in Irvine TX?

Newsgroup: rec.ham-radio
Date: 1990-12-25 05:37:44 UTC
From: faunt@CISCO.COM
Message-ID: <9012250538.AA00952@ucsd.edu>
Source record: 5059

Has anyone on this list been there? I saw a blurb at the community radio station where I work with a picture of a VOA control board that was used from late 50's to 70's. It looks like it might be interesting.
I'd be interested in hearing about other museums with interesting communications exhibits. I tried to see a Communications Museum in Leningrad when I was there a year and a half ago, but it was closed for renovation. I'm told there's a telephone museum in downtown San Francisco but I've not followed up on that yet.
73, doug

4651. PRO-2006 800MHz Mod

Newsgroup: rec.ham-radio
Date: 1990-12-25 06:36:00 UTC
From: 812spg@SACEMNET.AF.MIL
Message-ID: <9012250638.AA04897@ucsd.edu>
Source record: 5060

I've recently purchased a REALISTIC PRO-2006 scanning receiver and have a question regarding a modification -- restoration of the disabled frequencies in the 800MHz area. I apologize if this is the 'umpteenth this question has been posed.

Browsing through the January 1991 issue of "Monitoring Times" magazine, there was a reference to simply cutting a wire and hitting a key. Sounds simple enough!

Anyone that might be able to provide more explicit instructions would sure be of help! (If you might also know of other simple modifications, it would be appreciated!)

Thanks in advance...

4652. MAJOR SOLAR FLARE ALERT (24 DECEMBER)

Newsgroup: rec.ham-radio
Date: 1990-12-25 06:39:31 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901224233931.238021e6@HG.ULeth.CA>
Source record: 5062

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 24, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Region 6412 spawned a class X1.8/1B Tenflare at 15:41 UT on 24 December. This flare was accompanied by modest radio burst emissions. The emissions resembled a Castelli-U type signature. The position of this flare was N10W80, which was just prior to the disappearance of Region 6412 from the western limb. Radio emissions at 245 MHz reached 2,600 s.f.u., but no significant sweep frequency events were recorded. Satellite-altitude protons again became enhanced due to this major energetic event. Protons at greater than 10 MeV became enhanced at 18:50 UT on 24 December, reaching 3 PFU at 20:35 UT on 24 December. Satellite level protons are expected to remain at enhanced levels for at least the next 24 hours.

Solar activity today has been quite high. Excluding the major X-class flare, three additional M-class flares occurred from Region 6420: a class M1.0/SF at 01:06 UT, a class M2.2/1F at 13:26 UT, and a class M1.0/1F at 23:00 UT (all on 24 December).

Complex region 6420 has now been split into three separate regions: Region 6422 (S16E46), 6423 (S19E24), and 6424 (S08E31). All of these regions are capable of producing M-class flares with a small risk for a major M-class flare.

The Space Environment Services Center has issued a condition YELLOW alert status for potential satellite proton events and PCA activity. This is in response to the powerful X-class flaring which has been occurring from Region 6412. This region has now rotated beyond the western limb, but will remain capable of producing terrestrially-influencable major flaring for about the next 24 to 48 hours. The potential for major flaring will be reduced by about 26 December provided the cluster of regions near 6420 do not change significantly in complexity.

POTENTIAL TERRESTRIAL IMPACT FORECAST

There is not expected to be a geomagnetic impact from the major X-class flare which erupted today from Region 6412. Geomagnetic activity is expected to remain mostly quiet to unsettled until about 27 December when activity could increase to active levels over low and middle latitudes. High

latitudes may experience brief periods of low-intensity minor storming. Overall activity should remain mostly unsettled.

HF propagation conditions are expected to suffer from periodic fading and distortion over the next three days at least, due to frequent solar flaring. The durations of these SID's could surpass 60 minutes. The average SID duration is expected to be near 40 minutes. SID intensities will vary according to the strength of the solar flares, but should not provide anything worse than moderate fading and distortion.

Communications via polar paths are discouraged at this time. Absorption levels due to the recent solar activity and proton enhancements have increased over polar regions. The absorption is expected to continue for at least the next several days (until at least 27 December).

SHORT TERM SOLAR FORECAST

Regions 6398 and 6399 are due to return over the next 72 hours. These regions were responsible for significant levels of M-class flaring on the last rotation. The activity at these solar longitudes was quite impressive. This region rotated beyond the western limb in a very active configuration two weeks ago. If predictions are correct, these active longitudes should return in configurations still capable of producing potentially frequent M-class flaring. There is a notable risk that regions in these longitudes may have formed with characteristics capable of spawning major flares. More will be known as these regions begin to return.

It appears as though activity levels and indices may actually peak with the return of these active longitudes, which would correlate fairly well with prediction models which suggest a peak in early 1991. If Region 6412 returns as expected, it could very well return with a significant amount of magnetic and optical complexity capable of producing major activity. This region is a long-lived center which has retained a large size and respectable magnetic complexity throughout its last transit. This lends strength to the models which predict potentially significant activity from this center when it returns near 07 December. So January appears to look increasingly attractive with regards to a potential peak in solar activity.

Here's an awk text-to-Morse translator that will work on SCO consoles...

John DuBois
spcecdt@deeptht.santa-cruz.ca.us

```
:
# Morse to ascii translator
# John H. DuBois III 11/90
# Written for XENIX console; depends on SYSV tty modes (cr2)
# and SCO ANSI set-beep-length escape code
# Stuck at max ~8 wpm by shortest console beep & length of cr2 delay

# save tty mode so it can be reset
ttymode=`stty -g < /dev/tty`
# reset tty mode if program aborted
trap "stty $ttymode < /dev/tty" INT QUIT
# set cr2 so that cr delays can be used for timing
stty cr2 < /dev/tty
# set bell to 1/(1487*840.3ns) Hz (800 Hz), 100 mS duration
# note: bell is *not* reset at end of script,
# since there's no way to tell what it was set to from a script
echo -n "\033[=1487;1B"

tr '[A-Z]' '[a-z]' | awk '
BEGIN {
split("a.- b-... c-.-. d-.. e. f..-. g--. h.... i.. j.--- k-.- l.-.."\
" m-- n-. o--- p.--. q--.- r.-. s... t- u..- v...- w.-- x-..- y-.-- z--.."\
" ,--..-- ..-.-.- --...- =-...- /-..-. E.-.-."\
" 0----- 1.---- 2..--- 3...-- 4....- 5..... 6-.... 7--... 8---.. 9----.",
Data," ")
Delay = "\015"
S["."] = "\07" Delay
S["-"] = "\07\07\07" Delay Delay
Char = Delay Delay
Word = Char Char Char
for (i in Data) {
Letter = substr(Data[i],1,1)

CW/Morse-code itself may not be so interesting as a modulation/coding technique any more. But how experienced operators decode morse-code is very interesting.

After operating CW intensively in those contests, every hiss sound is decoded as Morse-code for me. Even wind seems calling like 'DE ....'. This symptom continues almost for a day, until I get enough sleep. My ear/nerve/brain system seems over adaptive to morse-code :-) Some kind of matched filter must be formed in my brain. Or it has been already built in my brain after years of over dose to CW. (addictive) And a hour of intensive operation may activate it.

As a little bit old-fashioned ham operator, I like CW very much.

As a scientist, I am very much interested in how human brain is adapted to CW/Morse-code. (Though I am amature in neuro science.)

As an engineer, I want to emulate CW decoding mechanism of human brain by electronics such as DSP, neural network, software, ...
Interesting enough !

As someone pointed at, CW is like bicycle. Both are easy for human, but very difficult for machine to manipulate. Is there already a robot which can ride bicycle very well ?

Thanks for the support. I'm glad that there are some hams that
recognize the fact that non code hams can contribute to the ham
community. Personally, I'm a very busy person, and would not want to
devote the time to learn code, only to abandon it after getty my licence.

I want to play mostly with 2M and packet, I don't need moorse for that.

I haven't followed this group for some time (years!). But at that time there was some talk of applying DSP techniques for ham radio modems; I don't remember who it was but someone planned to do some work using a DSP board (TI chip I think) for a PC. Did anything ever come out of it?

Also, I think someone offere his DSP board for sale a couple of months ago - I cannot access the message anymore, so I'd be interested to know who it was if the board is still there, or to know about any other sources.

4660. Statistics for NoCode articles

Newsgroup: rec.ham-radio
Date: 1990-12-26 15:37:00 UTC

Message-ID: <40148@genrad.UUCP>
Source record: 5070

Here's something to lighten your spirits in this Christmas season.
After coming back from Christmas Day vacation and trudging thru many
articles on the good and bad points about NoCode, I decided to get
some statistics (ok, so I'm a Math major :-).

I started keeping track of the posters and whether or not they were for or
against NoCode, or if I couldn't tell, and if they were against Code
(big difference between being for NoCode and being against Code). I've
got a list of about 20 names with my category assignments......But then
I figured if I posted that, I'd get flamed for posting it, so I didn't.

But then I went back and did a manual search to determine HOW MANY
articles there have been on NoCode. My computer still stores about 1200
articles, reaching back well beyond the 13Dec90 announcement.

The first article posted I could find was "Where is it going?" dated
6Dec90. Next one was posted on 9Dec90...and it was in full force by
then, even BEFORE the Official Announcement on 13Dec90. Of the 782
articles since since 9Dec90, (drum roll, please) 336 of them were on
the NoCode war and 128 of them were on the rec.ham->rec.radio.amateur
war. That means 43% of all articles has been NoCode, 16% has been
admin related, and only 40% has been the cream that most of us read
rec.ham-radio for.

Now, can we please get back to "the good old days" and get some
substance back into rec.ham-radio?

CHEERS and have a Happy New Year!

+I always find it interesting that it is the long-term Technicians that
---
+propose the two level or classes license structure. I wonder want the
+real motivation is to propose the present Techs should be grandfathered
+to full HF priviledges. I feel it more they want the full HF priviledges
+and don't want to learn the code. Actually there is more to learning
---
+the code on upgrading. It also is learning the answers to more theroy
+questions. Otherwise there would be few if any General class license
+holders.

Your errors in sentence structure and spelling notwithstanding, the real reason lies in the perception that there is little if any difference between the Tech (element 3, pre-Novice Enhancement) and General class licensee.

We already learned the code, and demonstrated that skill at 5 WPM.

In fact, some of us have technical skills that far surpass those of our brethern with General tickets; the reason? While the Generals have been busy blasting away at 14.313, the Techs have been building antennas for OSCAR, amps for 1.2 GHz, linked microwave systems at 10 GHz and playing with the packet and DSP techniques...done any of that stuff??!!

+
+Most countries that have fewer classes than the US still have some
+minimal requirement for minimal priviledges, and a full priviledge
+class for a more difficult exam along with a no-code license. This is
+a more reasonable proposal.
+
+Jim, WA6SDM
+jholly@hpcupt1.cup.hp.com

Most countries are not AMERICA! I would suggest you go have a look and see how many jobs are available for buggy-whip makers and then get grip on reality! This nonsense about CW has just about run it's course, most hams are beginning to understand that the FCC isn't going to play the "good-ole-boy" games that the OF's in the ARRL have been whimpering about for the last 40 years. It's not 1955 anymore, in case you haven't noticed!

A two-tier license structure, or whatever. Just so long as the CW test is kicked back to 5 WPM. There's really no reason whatsoever for anything faster in terms of the ITU regs, or the skill level of the operator.

If you could explain ONE real reason why that 13 WPM/Element 1b makes a ham any better, I'd love to hear it! To my way of thinking, it's just another stumbling block - another way of keeping the inner-sanctum of HF from people that would be interested in it bringing technical growth to it! (no :-)'s here...I'm very serious about this.)

4663. US/USSR/JAPAN FARS RADIOSPORT GAMES IN MAY

Newsgroup: rec.ham-radio
Date: 1990-12-26 19:04:50 UTC
From: Robert_e_LaGrone@cup.portal.com
Message-ID: <37249@cup.portal.com>
Source record: 5072

RADIO SPORT GAMES, 1991

(The following is directed mainly to hams in the states of Oregon, Washington, and California and all the other western states. We thought it might also be of interest to the general rec.ham-radio community.--Bob.)

Greetings to all members and friends of the Friendship Amateur Radio Society, Inc. (FARS).

International radio sport history was made in September 1989. For seven days, the Portland, Oregon and Niigata
Japan Radiosports teams had the great pleasure of representing the U.S. amateur and Japanese radio fraternity at
the First Sister Cities Friendship Radio Sports Games in Khabarovsk, USSR.

The Portland Oregon Radiosport Games, planned for 1991 are the follow on event to the '89 games held in
Khabarovsk. This event will bring together teams representing the US, Japan, Canada and the Soviet Union.

The Portland games will consist of 3 main events beginning with CW sending and receiving to test Morse Code
skills. The Portland event will continue with team DF and conclude with the HF operating events.

THE CW COMPETITION

Reception of the Morse code is judged on speed of reception (1 minuteK of correct copy) and the number of errors during the test run.
scoring may be given for the method_ ofN transcription of the received text when handwritten.

The transmission of the Morse code is judged in three major areas, speed, correctness of transmission and style.
The competition also contains bonus scoring based on the difficulty of the keying device -- straight key, vibroplex
key or automatic keyer.

THE OPERATING EVENT

The operating event includes a traditional HF sprint hosted at 5 stations in the Portland area. The contest will be
conducted round robin with each team operating a portion of the contest at each of the five stations.

The HF event is a single transmitter event with only one signal on the air at any given time. Additional

transmitting, receiving and antenna equipment may be present at the site provided only one transmitter is active at any given time.

During the HF sprint operating of the station shall be divided among members of the team with each receiving approximately equal operating time. Each operator shall be responsible for establishing, exchanging QSO information and logging the contact. The remaining members of the team may monitor the bands and act as spotters when not activelyK operating.

THE FOX HUNT

The Fox Hunt will be conducted according to international rules and is proposed for Portlands Forest Park. It will include 5 hidden transmitters located throughout the park.

WE NEED YOUR SUPPORT

Formal invitations (both personal and State Department) will be sent to the Soviet team via personal courier on December 16, 1990. The Soviets will be sending a team of (12) individuals, and have provided complete personal information on all of them. Their number includes a number of our dear friends, with whom we competed in Khabarovsk in 1989.

Yuzo, JR1WYB, a facilitator of the 1989 Games in Khabarovsk, left for Japan on December 9, and will be pursuing a number of objectives for FARS. He will be writing an article about the games for the pre-eminent Japanese ham magazine, "CQ Ham Radio," and will be soliciting the Japanese team for the 1991 games. Oba Zenichi, JN1JPX, a member of the 1989 Japanese team, has indicated interest in organizing the 1991 Japanese team, and will spend time discussing this with Yuzo during his visit.

Yoshiko, another 1989 Japanese team member, has communicated her great desire to compete in the 1991 games, and is expected to assist Oba in his efforts. Both Yuzo and Oba are fluent in Japanese, English and Russian, and are two of our premier supporters in Japan.

Short of a full page column, this account should reflect the excitement and momentum of preparations for the 1991 games. Much effort is currently being expended on three continents by individuals concerned for the continued international cooperation of amateur radio operators and the promotion of international radiosport and the Sister-Cities Friendship Amateur Radiosport Games 1991. We are also actively promoting Radiosport as an official activity of the International Olympics games.

While the balance of the news is good, I must again solicit your support. FARS needs you!!!! In particular, FARS
needs individuals to work in the areas of:
1)Planning/Organization - Board of Directors,
2) Housing for Guests/Competitors,
3) Trans- portation of international participants to events and excursions during visit,
4) Hosts for international visitors - both Japanese and Soviet guests will want to spend time (dinner, family outings)
with American Hams. All have expressed a desire to experience our culture and family life,
5) Individuals willing to help conduct the competitive events of CW sending and receiving side),
Direction-Finding (DF - Portland), and HF DX (Portland). Guest/Competitors at the 1991 Games will be attending
for the events, but will value their experience of us as individuals and our way of life at least as much as any of their other activities.

6) We are also looking for those of you who are interested in serving as judges or participants as competitors on
the US teams. Send us a note about your self and your qualifications.

FARS REALLY DOES NEED YOU!!! - as representatives of the finest hobby in the world, our American Way
of Life, and what all of us at FARS&? consider to be the greatest community in the U.S.A.!

If you are not currently a FARS member, we'd like to encourage you to join NOW! FARS will value any
individual contributions offered. Your ideas and participation are vital! As we embark on formal fund-raising in
the business sector, contributions of funds would be very useful, and we solicit them from you as individuals or
organizations. Please send requests for membership information or contributions of skills or financial contributions
to: Friendship Amateur Radio Society, Inc., P.O. Box 13344, Portland, Oregon 97213.

73, Happy Holidays, and my hopes for international goodwill and fraternity through amateur radio

- Dick, UA0C\WA0DIM

Gripe whine moan, and now that you get what you whined for, gripe moan and slam the opposition. Please explain to me how you KNOW that this "great influx of super-techies" is sure to happen? The way I see it, passing the novice and tech written exams to get on the air is EASIER than it used to be. What happened to the "more technically oriented" exam that was supposed to go with the no-code license? I think it is abundantly obvious that the RATIO of "more sophisticated technical people" to enter via the no-code path will remain unchanged or drop as long as the written exam does not reflect the sophistication. I have been helping friends and acquaintences enter the hobby for over 15 years, at a much better than 1 per year rate. From the informal survey I have verbally conducted, MOST of the new no-coders are going to be the spouses of current hams. Heck, my MOTHER is going for her ticket now at the age of ??, (WR4A's XYL :-) I don't think she would be insulted if I told the net she is NOT a sophisticated technical person. Since I have started efforts here at Intergraph in forming a communications club, most (not all) of the interested parties are MOSTLY interested in 2m autopatch privs. A few computer hackers are interested in wireless BBS and packet (some even TCP/IP) and 1 or 2 in ATV.

Please explain to me why the no-code license is going to cause a big increase in super-techie types when the test is not super-techie?

OLDE-PHARTE NOT IN THE LEAST AFFRAID OF YOUR "influx of sophisticated technical people" CUZ I'LL BELEIVE IT WHEN I SEE IT AND I'LL GET OFF MY SOAP-BOX WHEN YOU QUIT YOUR PATHETIC WHINING AND UNFOUNDED

SPECULATION- Herbi (not of 14.313 fame) back to my DSP code, KM4JN

P.s. Keep it up Tad, somebody has to do it ....:-)

4666. Equipment ideas for the Microsats

Newsgroup: rec.ham-radio
Date: 1990-12-26 20:16:54 UTC
From: hicks@nikkor.enet.dec.com
Message-ID: <695@sousa.enet.dec.com>
Source record: 5075
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I've recently been bit by satellite QSO's and have been working CW via RS-10 and have been following the DOVE telemetry. I would now like to proceed to full use of the Microsats. I have just sent for my AMSAT membership and am awaiting books, etc that are on order.

I currently own an HF rig, a 2mFM rig and a TNC. I understand that I need 70 cm recieving capability and a PSK modem to copy the downlink of the packet data. My questions related to this are:

1. Do you have any first-hand experience with the recieving converters that take 435 down to 10m? I have seen adds for Hamtronics but would appreciate any feedback on any you are aware of and/or have experience with. Obviously, my preference would be an all-mode UHF rig, but with the rest of the equipment I'm gonna have to buy, I'd like to get by for a little less for now and add that later.

2. I would also like information on PSK modems for use with the Microsats. I have seen Paccomm's PSK-1 modem (which also copies Oscar 13 400 baud telemetry). I have heard of the G3RUH (?) PSK modem but know nothing about it. What are the rest of you using?

3. I have read that the Paccomm PSK-1 modem will not work with the Kantronics KPC TNC's (which I have) so I will most likely be looking at replacing my TNC, too. I would like to upgrade to a unit that will support KISS mode, TCP/IP, WEFAX, etc. as well as interface with the PSK modem. I would like to go with a unit that has some future, too. I am considering the PK232 and KAM. Any others? Any suggestions on any of them? Benefits, features you look for?

4. It sounds like a regular FM rig will work for the uplink on 2m. I have a Kenwood TR7800 (25W). Any problems with this? What are you folks using? Do I need a 2m all-band rig?

Thanks for any input. I appreciate the collective feedback and common sense approach from anyone. Satellite communications is an exciting new mode for me and want to spend my $$ wisely!

Sorry, but this is genuine disinformation. The ruling is that applicants will be required to pass elements 2 and 3a. Period. Those are the same 2 and 3a elements as are around today (though, of course, the question pools are modified ever so slightly from time to time). These elements are commonly called the Novice written element and the Technician written element. You must complete element 2 before you can take 3a. If you pass 2, you will be given a CSCE for it, valid for one year. Same for 3a. Completing both of these will qualify you for the new Technician license. Thus the thundering hordes who have been dying to get on the air could, if they wanted, run out and take these this weekend, then send in their 610 once the ruling takes effect. In order to upgrade to General, you would then take both 1b and 3b. In other words, you DO have to pass the Novice written exam before you can take the Technician written exam, you DO have to pass the Technician written exam before you can take the General written exam, etc. The only changes the ruling made were to drop element 1a as a requirement for Technician and to restrict Technicians who have not passed element 1a to 30 MHz and up.

4668. UOSAT-14 information request

Newsgroup: rec.ham-radio

I am interested in information on communicating with uo-14. I know that this satellite was just opened for amateur use. The baudrate is 9600bps. I would like to know the modulation used and information on the correct modem. What type of software should be used when exchanging data with the bird? Must one use ssb for the downlink as on the microsats? I would in addition like to know if the new DSP devices will be able to handle the uosat modem standard
? Any other information as well would be appreciated.

(My newsfeed here is getting decidedly erratic...Please e-mail comments
to me as well as posting them.)

There has been a lot of controversy surrounding the .legal group portion
of this proposal. Many posters have had problems with the name, on several
grounds. I asked for a better suggestion, and Bill Davidsen (I think...please
correct me if I'm wrong) suggested .policy. I've given it a lot of thought,
and have decided it's a reasonable suggestion. I haven't seen any comment
one way or the other, so I'm asking: Is this a better idea than .legal for
a group concerned with the endless legalities and such of ham radio?

While I'm here, I'll add that I'm going to extend the discussion period a
week, until January 7, both so we can resolve this issue before we go to a
vote and to make sure everyone has an opportunity to comment regardless of
the holidays. I've spoken via E-mail with Ekiot Lear, and he sees no problem
with that.

I didn't say it was sure to happen; I said some hams are afraid of it.

> The
> way I see it, passing the novice and tech written exams to get
> on the air is EASIER than it used to be.

The codeless Tech is an entry-level license and should be compared to Novice,
not to Tech-with-code. It is easier in terms of drudgework, but not in terms
of degree of understanding of radio required.

> Please explain to me why the no-code license is going to cause a
> big increase in super-techie types when the test is not super-techie?

Because the attitude among many RF professionals is that the old ham
requirements, with heavy emphasis on code, are simply outdated and antiquarian.
There have been messages on this newsgroup, from people who ought to know,
saying that there is considerable interest in the new license among EE
faculty and other such people.

> OLDE-PHARTE NOT IN THE LEAST AFFRAID OF YOUR "influx of sophisticated
> technical people" CUZ I'LL BELEIVE IT WHEN I SEE IT AND I'LL GET OFF
> MY SOAP-BOX WHEN YOU QUIT YOUR PATHETIC WHINING AND UNFOUNDED
> SPECULATION- Herbi (not of 14.313 fame) back to my DSP code, KM4JN

Why is any opinion you disagree with "pathetic whining"?

Anyhow, you're refuting things that I didn't say. I would *support* a general
toughening of the theory exams, and the only reason I consider the codeless
Tech exams acceptable is that, being entry-level, this license is intended to
compare with Novice rather than Tech-with-code.

We have to be careful to not make the opposite assumption -- that if
the ranks DO swell that they WERE kept out by the code. The swell may
be due to increased advertising, or due to people who never even tried
the code and don't know if they would have had trouble or not.

There was discussion some time ago on this subject and someone siad they ahd never heard CW between 27 and 28Mhz....Well Christmas day while mobiling to my mom's, I was tuning the Kenwood 680 across the HF "Freeband" area to see what was there and lo and behold about 27.425 I heard a CW QSO between a guy in Haiti and a guy in the states!!!!...BOTH running CW!!! and good fists too! The guy in haiti was 24, name Rick...and his rig was a 553 (whatever that is!)..he had to sign because of TVI (dont you love it!)...I couldnt quite pull the guy in the states out of the noise but he was there somewhere along the mid coast...i did heard him ask Rick if he would be on 10mtrs later????? Hmmmmm Guess there IS CW being used outside the ham bands after all..... (and the guys evidently were hams anyway!)
I kinda got interested in seeing what 10mtrs was like after hearing that and going into the Novice band work N1CAJ on 10cw while MOBILE using the mic PTT on my 680 and the rig in FULL cw bk-in...no cw key plugged in and NO sidetone either!! It was easy but Frank and I had a great QSO for about 30 minutes or so....Gee I kinda misssed that fun on 10m...maybe it time to get the knee key out again!
See ya on 10mtr CW???

I built one of the Hamtronics converters. Getting the local oscillator
stablized so that it would start reliably and still get a clean waveform
was a bear. If I hadn't had a spectrum analyser handy, I would probably
have given up. It works ok now, however. I personally like the converters
from Advanced Receiver Research. They are stable, sensitive, and have
reasonable noise figures. The only problem I have had is with lightning
induced surges blowing the gasfets.

>2. I would also like information on PSK modems for use with the

> using?

I'm using the G3RUH design from Radiokit. The modem went together easily.
It tuned up cleanly. And it works. I did have the advantage of a spectrum
analyser, dual trace 200 Mhz scope, and a frequency counter to make it
play, but these shouldn't be necessary. The Paccomm unit seems to be
a solid unit, but I haven't had any personal experience with it.

>3. I have read that the Paccomm PSK-1 modem will not work with the

> others? Any suggestions on any of them? Benefits, features you
> look for?

I would recomend a simple straight TNC2 clone such as the MFJ1270B or the Paccomm Tiny 2. I have used both extensively to interface various modems, G3RUH, WA4DSY 56k, Kantronic 2400, etc. Running KISS is a simple ROM replacement. I wouldn't bother with the multimode wonder boxes. The compromises inherent in a do everything box mean that they do nothing particularly well. Also, the external modems we are talking about are specifically designed to interface with the TNC2 and tying them to one of the multimode boxes is not straight forward. You can do it with the PK232, I've installed them for friends, but it's not simple. You have to go inside and find the signals that you need, cut traces, and patch in your own wiring. With the TNC2, the modems connect cleanly to the external modem disconnect header.

>4. It sounds like a regular FM rig will work for the uplink on 2m.
> I have a Kenwood TR7800 (25W). Any problems with this? What are
> you folks using? Do I need a 2m all-band rig?

The main thing you may need is a "mode J" filter to keep the 2 meter signal and it's harmonics out of the converter. Spectrum International sells a nice one. You can build one fairly easily if you are handy with metalworking tools.

I support the change of name to policy. The problem with legal in my mind
is that this is an international group and legal issues vary from one
administration to another. Policy encompasses a wider range of issues
that could be more inclusive of our international friends.

I still strongly urge the creation of a tech group as well as renaming
the base group to misc. These changes should minimize inappropriate
cross posts and give a pure tech enviornment to those who have demanded
it. If our mailing list administrator would agree to handle the tech
group as a separate mailing, I think that a lot of people would be happy.

I wouldn't be surprised if the RATIO of technical to non-technical types remains static. Especially if we don't do a good recruiting job. Still, this should result in relatively large NUMBER of new technical types joining the hobby. Many techies are not keen on operating events and could care less about the Morse operating mode. My personal recruiting count of techie EEs who have either already taken the written exams or are brushing up for them since the no-code license announcement stands at four. These folks have little interest in operating for operating's sake. They don't care about autopatches, they already have cellular phones. They want to try new ideas that they aren't allowed to try at work.

It's been my experience that the "autopatch amateurs" aren't very active amateurs. We have a couple of dozen club members who entered the old fashioned way who I would call "autopatch amateurs". They are almost never heard in QSO with anyone other than their spouses and are rarely on the air at all except to use the patch. The club tends to look at them simply as revenue enhancement. A few more won't appreciably effect our operations.

> Please explain to me why the no-code license is going to cause a
> big increase in super-techie types when the test is not super-techie?

Take this up with the FCC. They're the ones who decided not to require an Extra level written exam for the new class. My personal opinion is that requiring a super tough written exam would discourage youngsters who want to experiment and learn by doing. Amateur radio is supposed to be a lifelong learning and self-training service. If the entry requirement is at the expert level, then the purpose of the service is diluted. For those few who simply must have wallpaper to chart their progress, I'm sure the League could step in with programs similar to their high speed CW certificates, but this time testing technical progress. One certificate that already does this is AMSAT's ZRO Memorial Award. It measures your ability to receive extremely weak signals. Yeah, the signals are CW, but that gives the satellite enhusiasts a real reason to teach themselves Morse rather than being forced into it by government regulation. Continuous self training is one of the major purposes of amateur radio. A complex licensing structure does not necessarily aid this purpose, especially if it discourages entry in the first place by imposing requirements considered not germaine at the time by new entrants. Once they're hooked, they can learn what they need to know to operate new modes or experiment with new technologies. If this results in some "amateurish" operating practices on the air for a while as they master new skills, so be it. That's what "amateur" radio is supposed to be about. Otherwise we'd call it "professional" radio.

Very true. It's difficult to prove a positive while one negative can totally
discredit a theory. I should of said that we would know that code was not
the ONLY thing keeping them out of amateur radio. Amateur radio may have
a bad reputation with the general public for many reasons.

When I'm struck by the poor English in an article on the net, I usually look up to the headers to see if the posting* originated from a non-English speaking country, or someone whose name might indicate that English is not his native language. If would seem so, I merely feel sympathy for someone who has had to learn one of the most difficult languages in existence, and try my best to understand what he meant.

But when the posting originates from someone with a typically english-speaker's name and from somewhere that you could reasonably expect to have literate people, I can only assume that the same haste was used to form the thoughts and opinions as to compose the message. How much weight should I give such apparently half-baked ideas?

It is a regrettable truth that your ability to communicate your ideas clearly will greatly affect the influence they have on other people. If you can't communicate them, the most brilliant thoughts are of no value.

Furthermore, incorrect spelling reduces communication. Indeed, the person who suspects he has spelled a word incorrectly and marks it with (?sp) has thus indicated that he's not sure of the spelling, but he's also implied that you, the reader, aren't worth his time or effort to go and look up the correct form. How is a one to grade the ideas in a posting which implies such contempt for the reader?

Thus I would urge people who wish to have their ideas carefully considered by their readers to make the effort to ensure that their posting is clear, understandable, logical, spelled properly, and reasonably grammatically correct. This is an informal medium, and thus formal language is not required, but if you want to get your ideas across and make your point, you have to make the effort.

Sloppy writing indicates sloppy thinking.

>it! (no :-)'s here...I'm very serious about this.)

While I am a strong supporter of the no-code license for VHF/UHF/SHF, there
is one, and one only, very good reason to require a stumbling block to
access to HF. Crowding. The HF bands are the only bands in amateur radio
that are at or near saturation. In the commercial realm when bands are
saturated the FCC resorts to a lottery. In the amateur HF bands the crowd
control method is demonstration of high speed Morse operation. Not that
high speed Morse skills are essential for HF operation, nor that passing
a test is the best way to develop high speed Morse skills, but simply as
a crowd control measure. If you would prefer a lottery, I wouldn't mind,
but at least the Morse requirement gives amateurs a choice on whether
they wish to operate HF or not rather than depending on the luck of the
draw. While I am licensed to operate on the HF bands, I rarely do because
of the crowding and zoo-like atmosphere that already exists there. I'm
sure that most operators wouldn't like to see it get worse. If you have

a congestion control method that is better than the Morse hoop or a lottery, then spit it out. Don't think that the Morse requirement makes a better amateur, it doesn't. Address the real issue, spectrum congestion.

It wouldn't be "remembering", it would be news to me.
(a) non-hams have been trying for decades to get the CW requirement eliminated.
(b) The FCC recognizes Amateur Radio as a hobby, not an FCC organization. I
don't think they care a hoot about what kind of "talent" goes into the hobby,
so long as the "talent" obeys their rules.

>People forget where the no-code proposal came from. The FCC has been
>talking about it since 1940 and, until now, had been shouted down by
>the ham community every time.

I don't know about 1940, but I do seem to remember in 1955 there was some
noise from wannabe-hams demanding that the FCC drop the code requirements.
the response by the FCC was to open the 11-meter band (in 1958, I think) to
a no-code license category.

You are correct, however, in noting that the Ham community opposed lowering the
entry requirements. It opposed the simplification of the theory exams. It
opposed the elimination of one of the entry requirements (CW). It will
continue to oppose these until those in the hobby who feel differently become
the majority. I believe that, in the next year, there will be a "new majority"
because of the recent rules change. As has been said here before, it's a new
hobby and we will have to adjust to it; but some of us reserve the right to
say "I told you so".

4685. PK232 RTTY signal out of 90 degree phase

Newsgroup: rec.ham-radio
Date: 1990-12-27 16:47:23 UTC
From: jl@newt.sbi.com
Message-ID: <408@newt.sbi.com>
Source record: 4990
Cross-posted to: rec.radio.shortwave,rec.ham-radio,rec.ham-radio.packet

I measured the Mark/Space output of my PK232 in RTTY mode using
a scope and with the PK232 in loop back mode as described in the
PK232 manual (green and white wires connected on the Radio output
cable). I started transmitting using this setup in RTTY mode. The
characters typed were received OK but when I monitored the Mark/Space
scope output on the PK232, instead of the correct cross pattern on
the scope I got a signal slightly out of 90 degrees phase:

```
^ ^
__| |__ _\ \__
<__| |__> <__\ \_>
| | \ \
V V
```

Correct Mark/Space Measured Mark/Space
RTTY signal pattern RTTY signal pattern

Does anyone know how to adjust the PK232 so that the Mark and
Space signals be correctly at 90 degrees off phase ?

In addition, can anyone e-mail me the description of the
modifications to the PK232 in order to minimise RFI pick-up.
Any other mods will be apreciated as well.

> ever so slightly from time to time).

And there are a total of 55 questions. If you are upgrading, you don't
need to pass the 2a section. The test may have it on it.

> In other words, y
> DO have to pass the Novice written exam before you can take the Technician
> written exam, you DO have to pass the Technician written exam before you can
> take the General written exam, etc.

Please show me in the rules where it says this. The rules only say
you must pass 2a and 3a. They do not say you must pass 2a before taking
3a, nor do they say you may not take them both at the same time. If the
VEC creates a Technician written exam of two parts (2a and 3a) you need
only take that one test to become a Tech. In fact, there are places that
give you both at the same time.

The rules make NO reference to Technician Written Exam or Novice
Written Exam. Just 2a, 3a, etc. If you want to make up your own
terminology, please have it conform to the rules.

Actually, this was a rather timely comment. I got an ARRL memorandum yesterday that announced that there was an interesting little tid-bit in the Federal register recently that eliminated removal of all but RACES operations when the President involkes his War Powers. This is all from memory folks so I'm likely to get a little of this wrong but essentially it is now a joint decision making authority between NTIA(that is the government radio user's equivalent of FCC) and FCC to determine proper spectrum management during such emergency situations, and the radio user's responsibility to "stay tuned" to any change in their respective authorizations during such times. All pre-aranged shut-down of existing services as defined in the rules are now null and void I guess. The effectivity of this ruling was mid December if I recall so it is probably already in effect.

>
> Excuse me while I get an airsickness bag from my flight kit.

I agree. <<Surprised?>> I see no sense to a code test for a VHF only license. I see a certain amount of sense to requiring it for an HF license, not so much for what the licensee wants to do but for what someone else might need for him to do in a time of distress. Those circumstances don't arise as often as they once did, but circumstances are not yet such that it will NEVER happen again.

Having said that, however, I see little sense in reserving huge chunks of HF spectrum primarily for CW. If CW operators are as good as they say are, wading through QRM from other modes ought to be a breeze. [:->

Yes, by all means, judge people based on the country they live in, or the "ethnic" content of their name. DON'T EVER consider that the net is an informal medium of exchange, and that poorly spelled words DON'T mean poorly formed ideas. Forget the fact that there are some pretty rotten keyboards. Forget the fact that some English words just do not spell right. Forget that the world has become a small place, and people can move about -- some of those people from non-English speaking countries even move to the U.S.. Some of them even anglicize their names. Forget that there are few, if any, people who are payed to post to the net, and thus most people must do it in the limited time they have. Demand that every post go through a peer review process to remove spelling errors and logic flaws. Make all them damn foreigners hire someone to write their posts for them, so that YOU don't have to think.

And since you are so picky here, you should know that countries do not speak, period. The people in them do speak. Thus, there is no such thing as an "English speaking country". The people may speak English. The official language may be English. But a country that speaks? No.

> . How is a one to grade the ideas
> in a posting which implies such contempt for the reader?

And how are we to grade the ideas from someone who judges the poster based on national origin?

> Sloppy writing indicates sloppy thinking.
> - Brian

Sloppy thinking indicates sloppy thinking. Sloppy writing indicates sloppy writing. Poor spelling indicates poor spelling. Cute homilies like yours are just your justification for dismissing any ideas you don't like without any thought at all.

> *not "post" - a post is a wooden or metal object used to support things.

You post messages to the USEnet. These messages are known as "posts". I am sorry if you object to the term. That is your problem, though.

4694. Question about QSL card customs

Newsgroup: rec.ham-radio
Date: 1990-12-27 22:58:18 UTC
From: d_muller@suisse.enet.dec.com
Message-ID: <1990Dec27.175211@suisse.enet.dec.com>
Source record: 5007

I have a question regarding QSL cards. I'm a raw beginner, and
I've only had two QSOs so far. One of them was in Lithuania, so
I'm anxious to send a QSL card to make sure that I get one back.
However, I don't have any QSL cards yet. I have access to laser
printers and software that would allow me to make my own QSL card
layouts. Since I'm not sure how long I'll have my Novice call
(I want to upgrade soon), I'm reluctant to buy a lot of 500 cards.
Would it be considered bad form (no pun intended) to print some
QSL cards on regular paper, cut them out, and send them, rather
than having them printed professionally on heavy stock?

4695. MAJOR SOLAR FLARE ALERT (26 DECEMBER)

Newsgroup: rec.ham-radio
Date: 1990-12-28 01:25:50 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901227182550.23802333@HG.ULeth.CA>
Source record: 5004

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 26, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Please note that this report is one day late due to the Christmas
holidays.

A major solar flare occurred on 26 December from Region 6420. This
flare reach a class X1.9/2B rating, but was not associated with any Type II
or Type IV sweep frequency events as one might expect from a flare of this
intensity. The Tenflare was an impulsive type, reaching a peak intensity at
14:02 UT on 26 December, only six minutes after it started. The flare
was 31 minutes in duration, ending at 14:27 UT on 26 December. The location
of this flare was east of the central meridian at a position of S26E21.

Satellite-level protons returned to background levels on 26 December and
were not enhanced by this major energetic event.

Region 6420 is not expected to produce any more significant major flaring.

POTENTIAL TERRESTRIAL IMPACT FORECAST

This major flare is not expected to produce very significant terrestrial
activity. There is a slight risk that some material was ejected by this
flare, simply due to the power of this event. However, the lack of any
significant sweep frequency events from this flare strongly suggests that any
terrestrial impacts will likely be small.

The current prognosis suggests that geomagnetic activity may increase
slightly over the next 24 hours, but no significant storming is anticipated.
Activity may reach unsettled levels over middle latitudes with possible
active periods over higher latitudes. Overall, activity should remain
generally unsettled, with a return to more quiet levels on 29 December.

** End of Report **

The no-code movement began at WARC 1947 at Atlantic City, when several foreign delegations suggested that the code requirement had outlived its usefulness. If anything, the U.S. is a Johnny come lately in the no-code trend.

Boy, I wish I had a quarter for every worldly wise old-timer I heard say that in the 50's when the Novice and Technician Classes were created. You did know, didn't you, that the Novice and Technician Class licenses were the result of a communist plot to destroy civilization as we know it, and the holders thereof were NOT _REAL_ hams? R_E_A_L hams (whose only code test was at 13 wpm and who drew circuit diagrams on the written exam) should never talk to the strange new people with the weird (i.e., not 1 x 2 or 1 x 3) callsigns.

I've hacked a little on a version of NOS that Anders Klemets ported
to System V UNIX. It uses shared memory and semaphores. Each
application runs in a separate process and uses a simulated socket
library to communicate with the server process. I don't think
Anders sees it as anything more than an experiment because the
overhead of synchronization using semaphores does a good job of
gobbling up substantially more than a 10 MHz 68010 (my AT&T 3B1).
I made a change to interlock using a test-and-set instruction
on some shared memory before trying to get a major semaphore..it
increased the efficiency of the package enough so that it
is reasonably snappy, but I've had problems with synchronization
not working properly, so I can't call it a success.

Re: CW on 14.313

I heard KQ2C (or something like that) calling CQ there a couple nights ago. It was all hopelessly legal; there were two polite QRL?s, followed by a CQ. This turkey then has the chutzpah to claim that two SSB stations were interfering with him ! That's the first time I've ever heard that SSB can interfere with CW. Maybe KQ2C needs better filters. :)

I think this is the right idea, though. Convert 14.310-14.316 to a digital subband.

Last thing first: Most important is the size: anything deviating from the "standard" 3.5 x 5.5 is a nuisance to file.Light card stock (like index) is quite a bit better than plain paper.

Most important thing is making cards count for something. There are lots of common errors:

Putting the sender's call where the receiver's call should be.
Getting date wrong (epecially from evening to midnig

Omitting the mode. "2xCW" or "2xSSB" etc are fine. AlA, etc, are not especially desirabe.

Why some insist on putting a frequency to the nearest 10 Hz escapes me.

As for your LY: very fine first or 2nd qso.

Could say more, but I've been going for about 18 hours so far today, and I'm quitting for the night.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 5 of 5

NEWS FROM CANADA

* The Canadian Radio Relay League and the Canadian Amateur Radio Federation met Oct. 14 to discuss a merger of the two groups. A draft constitution for a new, single Canadian organization was updated based on comments from boards of directors of the two bodies. The merger committee plans another meeting early in December, and tentative plans were made for the CRRL board and the CARF annual general meeting to be held "in a common location" in June, 1991.

* It may take a massive letter-writing campaign to Canada's Department of Commerce to get the new "Client Procedures Circular" rescinded, according to CRRL. The CPC, which will be published in its entirety in the December issue of QST Canada, is subtitled "Municipal Consultation on Non- Broadcasting Antennas," and is characterized by CRRL as "so poorly crafted that it lends itself to all kinds of interpretations and arbitrary decisions."

* Regarding new (as of Oct. 1) Canadian regulations based on the bandwidth of transmitted signals, that 1200-baud packet operation falls within the 6-kHz maximum bandwidth allowed on 160-12 meters (except 30 meters). CRRL and CARF ask that Amateurs NOT use 1200-baud packet on the HF bands "until the CRRL and CARF form a band planning committee and the matter has been studied."

CONFERENCE HONORS ARMSTRONG

Edwin Howard Armstrong, "the Major," would have been 100 years old this year. The centennial of his birth has spawned a number of projects and retrospectives, the latest of which was a conference held Nov. 16 at Columbia University, his alma mater and where for many years he was a faculty member.

Attending the conference, held at the Columbia Center for Telecommunications and Information Studies in New York City, was ARRL Executive Vice President David Sumner, K1ZZ. Sumner participated in discussions of papers presented at the conference, particularly those concerned with the commercial development of FM (which Armstrong invented) in the U.S.

Maj. Armstrong was widely regarded as having strong roots in Amateur Radio. Although his experimentation as a "ham" predated licensing, Armstrong helped build and operate the Radio Club of America station 1BCG that was the first to be heard by the League's Paul Godley at Ardrossan, Scotland, in 1921.

It was just this sort of unstructured, "amateur" experimentation that Armstrong carried over into his many technical breakthroughs, which included invention of the regenerative circuit (1912); the superheterodyne (1917); and wide band FM (1933).

Also present at the conference was Thomas Lewis of Skidmore College, who is helping produce the film "Empire of the Air," a PBS documentary about the early days of broadcasting that is scheduled for airing next fall. Lewis is pictured with Bruce Kelley, W2ICE, in the Oct. 19 issue of The ARRL Letter.

PLEASE GO AWAY

Here is the latest list of intruders in our HF bands which the ARRL has asked FCC's Treaty Branch to pursue with other countries as well as our own:

* 1813-1820 kHz, A2A (beacon transmitters);
* 7008, F1 (TTY idling and traffic);
* 14221, R7B/F1B (250/500 Hz shift TTY and Mux);
* 14312, F1 (high speed digital keying, 1 kHz shift);
* 18090, F1 (140 baud encrypted, 500 Hz shift);
* 18095.5, F1 (idling signal, 2 kHz shift);
* 18125, F1 (50 baud, 400 Hz shift, some encryption);
* 18138.5, F1 (140 baud, encrypted).

BRIEFS

* The League's latest move against the reallocation of part of the 220 MHz band to commercial interests was played out in court Nov. 16, when oral arguments were presented by the ARRL as plaintiff and the FCC as defendant, to the U.S. Court of Appeals, D.C. circuit. A panel of three judges heard the arguments and questioned both sides in the request for judicial review. The Court's decision is expected in a few weeks.

* The preliminary position on the 40-meter band contained in the FCC's Second Notice of Inquiry in Docket 89-554 generally was supported at the final 1990 meeting of the FCC WARC-92 Advisory Committee's Informal Working Group No. 1, held in Washington Nov. 8, according to EVP K1ZZ, who attended as a member of the working group.

Background on this can be found in the Oct. 5 issue of The ARRL Letter and in Nov. QST.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 4 of 5

FCC TWEAKS AMATEUR RULES

The Federal Communications Commission has addressed a number of proposals for changes to its Part 97 Rules for the Amateur Service, in response to petitions by the ARRL as well as several individuals. The Commission's Notice of Proposed Rule Making in Docket 90-561 was released Nov. 16. Here are the highlights:

* The ARRL asked that the terms "telecommand," telemetry," and "space telemetry" be defined in the Rules; FCC agreed. The terms "tactical call sign" and "digipeater" will not be codified.

* ARRL sought an increase in the minimum number of club members necessary to apply for a club station license, from two to four. But the Commission noted that no new club station licenses have been issued for some 13 years and "we do not foresee that we will resume doing so," so the point was moot. The League continues to urge the Commission to resume the issuance of new club station licenses.

* FCC declined a request to amend its Rule that states an Amateur station must be independent of all other radio apparatus installed on a ship or aircraft. The League's argument in this case was that a regulation already is in place prohibiting an Amateur signal from interfering with other apparatus aboard.

* In the matter of prohibition of automatic control of Amateur stations when third party traffic is being handled, the League sought a rules revision to put the responsibility for the content of such traffic on the originating Amateur station. The Commission, however, maintained that traffic content is the responsibility of every station, including those who retransmit communications, and proposed no change.

In a related matter, ARRL sought a clarification of Section 97.109(d), to emphasize that a Commission representative may order an automatically controlled station to shut down because of improper operation or harmful interference only after the alleged offending station has been given the opportunity for a hearing.

FCC denied this, saying that "the control operator must cease automatic control of the station upon notification by an Engineer in Charge that the station is transmitting improperly or causing interference to other stations, and the licensee is not entitled to a hearing before such notification."

* The FCC declined to amend its Rules to permit retransmissions of other services--NOAA weather and DOC propagation broadcasts--saying such transmissions are "routinely available over the air with inexpensive receivers."

* The FCC agreed to amend its Rule regarding compensation of club station operators, lowering the number of simultaneous bands on which bulletins and code practice must be transmitted from ten to six.

* A request to ease the FCC Rules regarding third party communications on behalf of someone holding an Amateur Radio license but not eligible to be a control operator of an FCC- licensed station was denied. The Commission said this had already been considered (in the most recent Rules rewrite) and denied at that time.

* A request by an individual Amateur to require stations to identify at the beginning of communications through a repeater was not included in the proposals, but FCC asked for comments in the matter.

* FCC declined to entertain a change in its Rules to incorporate due-process procedures in cases involving "quiet hours," saying that it was unnecessary.

* In the area of Special Operations, FCC agreed to:

1. Amend its Rules to delete the condition that an auxiliary station can be automatically controlled only when it is part of a repeater system, so that Amateur operators can experiment with new system configurations that use auxiliary links;

2. Expand the permissible types of space telemetry transmissions as requested by the ARRL;

3. Make minor changes in wording, including changing "remote control" to "telecommand."

* The FCC once again refused to change its Rules banning 10-meter power amplifiers, saying the ban "makes our enforcement procedures more efficient and effective."

* A request that persons whose Amateur station or operator license has been revoked or suspended be allowed to qualify as a volunteer examiner after a 10-year period was turned down.

Interested parties may file comments on or before Jan. 31, 1991; reply comments are due by March 4, 1991. Extensions of time are not contemplated, according to the FCC.

HAMS HELP TRACK ANOTHER ALLEGED JAMMER - (Continued)

"Barney" feels the heat

Barney at this point apparently became suspicious and for several days curtailed his transmitting.

Additional transmissions were noted on the TARA repeater, and on state police, county radio, and the Norristown Fire Department frequencies, as Barney gradually resumed operations beginning the weekend of Sept. 15-16. FCC engineers meanwhile narrowed the source down to a particular house in the congested area.

For the next two weeks monitoring increased, as efforts began to identify the occupants of the house, which appeared to be divided into apartments. Any search warrant issued would have to be for a specific apartment rather than for the whole building.

At the end of September the U.S. Attorney was presented with evidence gathered up to that time. Montgomery County Communications Chief Dennis Parker and Norristown Fire Department Chief Joe DeDominic were asked to provide evidence they had gathered about interference to their operations and to file formal complaints.

In early October the jamming increased, and included harrassment of the Norristown F.D. on Oct 20, 23, and 26. In one transmission Barney tried to recall several trucks from a fire call. By that time the fire department had filed a formal complaint with the FCC.

On Oct. 19, U.S. marshals and FCC personnel, acting on a search warrant issued by the U.S. Attorney, entered the suspect house. But no radio equipment was found.

Although the raid was a disappointment, the FCC continued its probe. The landlord of the row house next to the house that had been searched

told Rahtes that one of his tenants was known to have several radios and antennas in his room at the front of the building. The landlord supplied additional information, such as the tenant's work hours, which seemed to confirm that this individual was indeed the likely suspect.

>From the landlord's first floor apartment Rahtes took field strength measurements, and was able to hear Barney operating his equipment through the thin walls of the building.

On Nov 1, the Radio Amateur Civil Emergency Service repeater in Eagleville, PA, reported unauthorized access to its 911 emergency system. RACES net members were being beeped day and night, adding to the FCC's case for securing another search warrant, which soon was issued.

TARA president E.C. "Gene" Pressler, W3ZXV, joined FCC personnel and U.S. marshals to enter the suspect premises. Several pieces of radio equipment were discovered, along with a directional antenna suspended from the ceiling, and other evidence.

Pressler then operated the suspect's equipment as FCC engineers Barry Peahota and Frank Hurst made recordings of the signal, for later signal and voice print analysis comparison with taped jamming transmissions.

Included among the equipment confiscated were two hand-held transceivers, as well as several scanners, most of which were in operation at the time of the search.

At presstime, no charges had yet been filed against Woods.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 2 of 5

HAMS HELP TRACK ANOTHER ALLEGED JAMMER

Another alleged radio jammer has been silenced due in part to the efforts of Amateur Radio operators. On November 6 U.S. marshals and engineers from the FCC's Langhorne, PA field office seized radio equipment, belonging to Ernest Woods, 30, of Norristown, believed to have been used to interfere with Philadelphia-area 2-meter Amateur repeaters, as well as frequencies of the Pennsylvania State Police, the Norristown fire department, and other public service agencies.

Woods could face serious civil and criminal charges as a result. Woods was issued Novice class amateur license KA3WHZ in May 1990 and a Technician license in August.

In late June users of the Telford (PA) Area Repeater Association (TARA) began to experience "persistent and purposeful interference" to their 145.190 MHz repeater. In early August the TARA executive committee and TARA's control operators met to discuss the situation, after the jammer had gotten access, apparently through trial and error, to the repeater's phone patch and speed dial codes.

Concerned for the integrity of the repeater's emergency service codes, TARA on August 8 changed these services to "controlled access," and at the same time began efforts to pinpoint the source of the interfering signal. Standard Amateur fox-hunting techniques soon narrowed the source of the signal to a neighborhood of Norristown, about 20 miles from downtown Philadelphia.

On August 27 a preliminary formal complaint--with tape recordings--was filed by TARA's president with the Engineer in Charge of the FCC field office in Langhorne, PA. Area ARRL and repeater officials were at that time notified of the situation.

On September 2, a team once again tracked "Barney," as they called the jammer, and concluded that additional equipment would be needed to positively identify the specific house from which the signal was being transmitted.

On September 6 a TARA official and one from the Fairview Village 2-meter repeater joined forces, using a Doppler Systems direction finding unit to localize the source of the signal to the same area.

Four days later, a station wss copied interfering with several Pennsylvania State Police channels in the 159-MHz range. A TARA official monitored the police frequencies long enough to confirm to his satisfaction that the interfering operator probably was the TARA repeater jammer.

TARA informed the Pennsylvania State Police of their on- going search for their repeater jammer, and were told the cops had been forced to move to alternate frequencies because of the jammer.

As word spread through various agencies, interference to the state police continued, with Barney telling the troopers to "drop dead" and at one point making a false report of an accident.

By Sept. 12 the FCC had stepped in, to act on complaints both from TARA and from the state police. Engineer-in-Charge John Rahtes asked for TARA's assistance: Rahtes needed a safe house in the immediate neighborhood where his agency could set up equipment to monitor the jammer, identify him, and gather legal evidence.

A vacant third floor apartment was located a half-block from the suspected source of the signal and the FCC installed its equipment, including gear capable of identifying transmitters by their signal signatures. TARA personnel assisted the FCC in monitoring over the next few weeks.
. . . . Continued next part

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 1 of 5

MEMBERS CHOOSE NEW DIRECTORS

ARRL members in the Northwestern and West Gulf Divisions have voted to send new representatives to the ARRL Board, and in the Hudson Division have returned the incumbent to office for another term. Ballots in these and two other contested elections for 1991-1992 terms of office were counted by the Committee of Tellers November 20 at League Headquarters.

The Northwestern Division race was between Mary Lewis, W7QGP, the present ARRL Section Manager of Western Washington and a past Director of the Divison, and incumbent Bill Shrader, W7QMU. Shrader advanced from the position of Vice Director to Director a year ago following the resignation of Rush Drake, W7RM, for health reasons. Lewis was elected by a margin of 110 votes, 2,382 to 2,272. The incumbent Vice Director, Mary Lou Brown, NM7N, was unopposed for reelection.

In the West Gulf Division, the incumbent Director, Sam Sitton, KV5X, had moved up to that position from Vice Director in January following the election of Jim Haynie, WB5JBP, as an ARRL Vice President. Tom Comstock, N5TC, a past Vice Director, had been appointed to fill the Vice Director vacancy. For the new term, however, Sitton decided to run for Vice Director and was elected without opposition. Comstock ran for Director and was elected over Rik Albury, W5SOQ, by a margin of 2,641 to 1,234.

In the Hudson Division, Director Steve Mendelsohn, WA2DHF, was returned for a third term. In a replay of the 1988 election, Mendelsohn bested Vincent Biancomano, WB2EZG, 2,898 to 1,235. Vice Director Paul Vydareny, WB2VUK, was unopposed for reelection.

The other contests this year were for the Vice Director positions in the Rocky Mountain and Central Divisions.

In the Rocky Mountain Vice Director contest, where the incumbent was not seeking reelection, Bob Scupp, WB5YYX, defeated past Director Lys Carey, K0PGM, by the narrowest margin of the year: 948 to 925. Director Marshall Quiat, AG0X, was reelected without opposition.

In the Central Division, in the only three-way race of the year, incumbent Vice Director Howie Huntington, K9KM, defeated challengers Mike Hoshiko, W9CJW, and Ken Ebneter, K9EN. The three received 2,231, 1,065, and 928 votes respectively. Director Ed Metzger, W9PRN, previously had been declared reelected as the only eligible candidate.

The newly elected League officials take office at noon January 1, 1991, along with the Directors and Vice Directors previously declared elected without opposition in the New England, Roanoke, and Southwestern Divisions.

W1AW TO SHIFT 15 AND 10 M CW FREQUENCIES

Effective January 2, 1991, W1AW will transmit its code practice and CW bulletins on new frequencies in the 15 and 10 meter bands. The change is being made to avoid interference between W1AW and AMTOR operations, which have become very popular near the old frequencies that had been used by W1AW for many years.

The new frequencies will be 21.0675 and 28.0675 MHz, 10 kHz lower than the old frequencies.

PROPAGATION FORECAST BULLETIN 52 ARLP052
FROM ED TILTON, W1HDQ SPRING HILL FL
DECEMBER 26, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

In talking or writing about solar acitivity in a given month, we tend to pay more attention to the highs than to the lows, but if the solar flux finishes December at or near the present level, the low will be worth some attention. As of December 26 the minimum solar flux this month was 176, and that came on 1 December. Drop that first day and the December minimum so far would be 182, an exceptionally high figure.

Good winter conditions are also shown in the WWV A index. Through December 26, the A index high was 16, a moderate level. Only three 16s appear in the December reccord, and most A indices are much lower.

The apppearance of the Sun in recent days has shown little change through the afternoon of December 26, but the minor changes seen in both the solar surface and day to day radio propagation suggest that major changes are not far off. A special bulletin will be issued before December 31 if expectional conditions warrant.

American sunspot numbers for December 6 through 12 were 136, 172, 155, 166, 156, 135 and 110 respectively, with a mean figure of 147.1. For the week of December 13 through 19 they were 131, 113, 88, 109, 129, 155 and 150, with a mean figure of 125.

QST DE W1AW
DX BULLETIN 51 ARLD051
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 28, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

Thanks to Allen, N2KW, The TRISTATE DX PacketCluster Network, and the many others who made these DX Bulletins possible during 1990.

AFGHANISTAN. UT5RP has volunteered to assist YA0RR QSL duties. Dima says Romeo will operate for a three week period in January. Stateside coordinator NT2X is less optimistic, citing numerous obstacles to an early starting date.

ANGOLA. An Argentine group has targeted D2 for activation next Spring.

CHATHAM ISLAND. ZL0AAD/7 is on 7 MHz CW at 1200 UTC and ZL0ADN/7 is on 14 MHz SSB at 1100 UTC as well as other times. They will be active one more week. QSL to DJ1ND. ZL0AIC is in Antarctica and QSLs via HB9AAA.

CHRISTMAS ISLAND. A Japanese group plans an operation April 2 through 9.

COMOROS. D68JM likes 14 MHz SSB at 0400 UTC. QSL via WV4F.

FAROES. OY9JD has a good signal on 3799 KHz at 2130 UTC. Jon also likes 28 MHz SSB in the morning while OY1CT keeps the CW crowd happy.

FRANZ JOSEPH LAND. Now is the time of year to log this northern outpost as volleyball has been suspended for the winter. 4K2OIL with a strapping 17 meter signal, 4K2PGO and 4K2BDU on 20 meters, and 4K2PYL on 40 meters, all combine to make FJL available around the clock.

JAN MAYEN. JX7DFA has been active on 28 MHz RTTY at 1300 UTC and CW a bit later.

LEBANON. OD5SK and OD5RH both like 28 MHz SSB after 1400 UTC.

LESOTHO. 7P8CI and 7P8EB can be found on 10, 15 or 17 meter SSB most days after 1900 UTC.

MALAWI. 7Q7LA works 18 MHz CW at 1600 and 1900 UTC, and 14 MHz CW at 0430 UTC. QSL via G0IAS.

OMAN. A41KY and A47RS have been active on 28 MHz SSB at 1300 UTC. A41JZ prefers 7 MHz CW at 0300 UTC.

PAKISTAN. AP5HQ has a great signal on 14183 KHz at 0230 UTC. QSL via N0RR. Lets hope these conditions hold for the YA0RR operation.

QATAR. Both A71AL and A71CD like 28 MHz SSB at 1300 UTC.

RWANDA. 9X5SW visits the Brazil DX Net on Saturdays at 1300 UTC on 28533 KHz. QSL to DL1HH.

SAN FELIX. XQ0X has been very busy this week. All operations have been 14 and 28 MHz SSB. If you need this one, work him now before his work schedule expands. See NOTE 1.

SINGAPORE. 9V1XQ has a commanding signal on 14180 KHz after 2200 UTC. QSL via K2QBV.

SOUTH ORKNEY. VP8BXK visits various 20 meter nets as time permits. A Spanish scientific team will visit South Orkney and South Shetland during January. QSL ED0BOD and EG0BOD via EA4BOD.

SOUTH SHETLAND. 4K1ADQ joins HF0POL around February 1 in keeping this outpost very active.

TAIWAN. BV2FB likes 14 MHz SSB at 2330 UTC. QSL via AA6BB. BV2TA has a good signal on 7 MHz CW at 1230 UTC.

VANUATU. YJ8RN likes 14 MHz SSB at 0630 UTC. QSL to N9DRU.

ZAIRE. 9Q5TE is back from his SM holiday. Gus has an outstanding signal on 14 MHz SSB at 0500 UTC. 9Q5AA prefers 28 MHz SSB at 2300 UTC.

NOTE 1. XQ0X manager CE3ESS requests QSLs be sent to Box 9834, Santiago, Chile. Please send them after January 15.

NOTE 2. During 1990 the combined YCCC/TRISTATE PacketCluster Network logged over 300 countries. Among the 35,000 spots were 179 countries on top-band.

NOTE 3. UH8EA is workable on 3501 KHz at 0230 UTC. 3C1EA likes the same frequency. Add K1EA calling and things get very confusing.

NOTE 4. The NCDXC weekly bulletin is an excellent source of fresh information. Listen for W6TI on 14002 KHz at 0200 UTC each Monday.

NOTE 5. 9K2CS is back on the air operating portable in HZ awaiting his license. Please do not ask him about 7O1AA QSLs. The logs are in Kuwait and no QLSing is possible yet. Mohamed would like to attend the 1991 Dayton Hamvention.

NOTE 6. This bulletin marks the last in a series by N2KW who will be vacationing in Orlando, Florida, this winter. Allen regrets that being unable to log on to the TRISTATE node of K2GX will preclude further bulletins from him until later next Spring. Give him a call if you hear his mobile signal.

Good Luck on DX de KB8NW/OBS

>Write to the ARRL (don't just flame here!) if you object to this.

I just got a form letter from the ARRL offering me another chance to
renew (I had not done so due to increase in rates) and offered a free
book (I have one of every one they offered that was interesting).
I had, just after the FCC decision on No-Code Tech was announced,
to go ahead and take them up on it.

I will send it back to them, addressed to Larry Price, without a check,
instructing him to send me the offer again once the ARRL decides NOT
to pursue any changes to the new Technician privileges.

It's not just the new Techs that the ARRL could offend by such a petition.

Right. The ARRL has already offended quite many hams who have subsequently left (or never joined) the League. In addition to the fact that the league does NOT represent all of amateur radio, it certainly does not represent those people who would make up what amateur radio COULD be, even if they are potential League members.

>The people on ARRL staff that I have worked with, and our Southwest
>Division Director (Fried Hein) certainly don't fit your description.

>I get really tired of ARRL bashing. At least they actually do something
>to try to improve the hobby - within the limits set by their voting
>members.

The ARRL is, perhaps, a FOLLOWER instead of a LEADER.

As long as the ARRL is strictly following the wishes of one group, how can it possibly expect to attract membership from the other group. If the ARRL petitions to move the No-code tech boundary up from 30 MHz to 220 MHz, and of the FCC goes along, I suspect this would serve to do as much damage to the league itself, in addition to ham radio, as incentive licensing did, or worse.

I wonder what the league's policies would turn out to be if they took into consideration the position of EVERY ham AND every would-no no-code tech as if the membership of the league consisted of all of them? I'd like to see such a league. But the present means of operating at the ARRL serves strictly to preserve the boundaries between differences of opinion among hams and would-be hams, rather than try to get everyone together.

4712. Re: PRO-2006 Scanner Mod

Newsgroup: rec.ham-radio
Date: 1990-12-28 10:13:45 UTC
From: bt455s01@UHCCUX.UHCC.HAWAII.EDU
Message-ID: <9012281013.AA14571@uhccux.uhcc.Hawaii.Edu>
Source record: 5022

Someone asked how to modify their Radio Shack PRO-2006 Scanner to receive the blocked frequencies. Here's how.

Basically, what you will be doing is disconnecting diode D502. That's all.

1. Unplug the scanner from it's power source and remove the antenna(s).

2. Unscrew and remove the four phillip screws on the back panel of the scanner that hold the top and bottom half of the scanner's plastic case. No need to unscrew any of the other screws, just the top two and the bottom two.

3. Carefully remove the two halves of the scanner's plastic case by first pulling the case away from the front panel and then out. The top half of the plastic case has the speaker permanently attached to it with a wire connecting it to the top circuit board, so be sure to unplug the wire from the circuit board before you yank it off when you remove the case.

4. Diode D502, your target, is now in view. You will see it on the back of the circuit board behind the top right corner of the front panel (looking at it from the front). The diode is standing upright from the circuit board, so you're job of snipping it is made somewhat easier.

The diode is the second one from the top. The designator "D502" is printed in white on the circuit board at the foot of the diode. All you need to do is snip the wire that connects to the diode so as to disconnect it from the circuit. No need to remove the diode entirely, just cut the wire into it. If you don't have the proper tool to cut it, finger nail clippers will do the job beautifully. It maybe necessary to unscrew the front panel from the frame if there's not enough room for you to get at the diode. Just remember not to yank too hard when pulling the panel from the frame since the LED display, keypad, and other controls are still plugged into the circuit board. It really isn't necessary to unplug all these things, just move the panel slightly away; enough to give you room.

5. After disconnecting the diode, put everything back together the same way you took it apart (Did I really need to say that? :)

Your PRO-2006 scanner is now able to receive the previously blocked out frequencies of 823.945 MHz to 851 MHz, and 868.945 MHz to 896 MHz. It can now also step in 30 kHz increments in addition to 5 kHz, 12.5 kHz, and 50 kHz. You will notice 30 kHz in the LED display when you scan your new frequencies, unless of course you pressed the STEP button to change it. Once you press STEP, you will not be able to reselect 30 kHz again unless you reprogram.

And so endeth a layman's guide for modding the PRO-2006.

> QSL cards on regular paper, cut them out, and send them, rather
> than having them printed professionally on heavy stock?

As a sorter for the W1 Call Area, I would have to say that ANY piece of paper with the right information on it is good. Minimum information would be your callsign, his (or her) callsign (BLOCK LETTERS ARE BEST and make it clear WHICH CALLSIGN IT'S GOING TO), signal report, date, time in UTC and frequency, plus mode (CW, SSB, etc) if you intend to later use it for specialty certificates.

As a favor to the other station, I'd probably put his first name and qth in (especially if you send it thru the bureau. we can sometime figure out the real callsign by looking in the Callbooks and looking at the name and qth even when the callsign is questionable), as well as your own name and address and your county, if you know what it is (many foreigners collect "all county" qsl cards).

Another "it would be nice". Make the piece of paper approximately the size of a normal QSL card (3 1/2 x 5 1/2). They're easier to sort that way.

I got a real neat one a few days ago.....The QSL card was coming from Italy....going to USSR......it made a stop at my house along the way :-).

Michael Waugh writes:
>>I'm interested in the No code Tech class of ham licence.

>>What would be a good book to study, that would cover the

>>requirements for the written test.

The new Tech test will consist of the old Novice theory test,
plus the old 25 question Tech test. There are a number of
good books you can use, I recommend the following:
for Novice, the Ameco Amateur Radio Novice Class Theory Course.
Cat num. 23-01.
for Tech, the ARRL Tech theory book, I don't remember the exact
title.
Both of these books give you more information than you need to
pass the tests. In addition, the ARRL book gives you the
entire 250 question pool from which the test will be taken from.
(That is one deficiency in the Ameco book, it doesn't have the
questions in it. Another good book, ARRL's Tune in the World With
Ham Radio, does have the entire 300 question novice pool.)

Make sure you get the latest version of any book. These can be
purchased from any radio store, and the ARRL books can, I believe,
be purchased directly from the ARRL.

If you have a Mac computer, someone on the net has typed the entire
question pools into Hypercard, so that may help you if you get
that.
Hope that helped, good luck.
Jim, NE3X

>

Dave:

I have in use daily the AEA DSP-2232 running a UO-14 modem.

A UO-14 modem is 9600 bps direct FSK. What that really means is that
you put shaped data on the modulator of in a true FM radio. You take
the data for receive directly from the discriminator in your FM receiver.
Since you do not wish to have much in the way of a DC bias in the bits
to be received or transmitted, the data is sent through a circuit
called a scrambler. This is not in use as an encryption device,
since their is no cryptovariable, and since it is self synchronizing.

There are several ways to go. The cheapest is to buy one of the many
variants of the G3RUH 9600 bps FSK modem. It is the best commercial
modem available to do this job. Both Kantronics and PacComm have
variants of it. The other is to wait for the DSP boxes to be released
as they will do this and more. I have a G3RUH (which I loaned to
someone else) and have not had a chance to use it on the satellite.
Others that are on the satellite are almost exclusively using the
G3RUH.

The uplink for UO-14 is 145.970 and the downlink is 435.075, please
compensate for doppler. You should be able to copy this extremely
loud signal with omni and your FM receiver (if it can tune 435.075).
You will see the S meter rise and the noise get quieter. What I mean
by this is that 9600 scrambled data sounds like `quiet FM noise' is
the best way I can describe it.

Did I help?

>

I believe this is inadequate if you wish to use omni's. If you want to save $100 over the cost of the PacComm PSK-1 and you wish good BER performance out of omni antennas, get the TAPR kit. TAPR is in Tuscon and I have forgotten the address and phone number. I probably should keep a copy of that here on my email machine at work, but I always manage to forget. If you are using omni's and have not compared results with a correctly tuned PSK modem from TAPR and/or PacComm (the paccomm is a licensed variant of the TAPR box), then I suggest you do so. The problem with the G3RUH is that it assumes a good SNR at all times. It is an all digital design and hard limits the signal as it comes into the box and then does a squaring loop demodulator. While the latter is theoretically equivalent to a Costas loop demod (as in the TAPR/PacComm), in practice it is almost never equivalent. Good lowpass filters are just inherently easier to do than bandpass of the same Q. Hard limiting is theoretically only 2.2 dB or so worse than not hard limiting. This is in the presence of white Gaussian noise. The noise out of most SSB radios is neither Gaussian or white. All taken together this leads to a 10 dB worse implementation loss of the G3RUH design over the TAPR. If you have not yet purchased a modem, and you do not yet have gain antennas, I strongly suggest that you consider another possibility and not use the G3RUH. If you have gain antennas already, there is so much link margin from these very loud satellites that the G3RUH is at no disadvantage except during the deepest fades and I would decide only on the basis of which is cheaper. On Gary's other comments concerning converters we are in complete agreement. Jan King and I have begun using discone with amazing results and I should be reporting on that soon enough.

Truth in advertising requires me to tell you that I get a royalty as one of the designers of the PacComm PSK-1. I am not sure but I believe the price of the kit from TAPR and the price of the kit from Radiokit are comparable. On that basis, if I were going to do a kit, I would do the one with the best performance but this is from vague memory. I would check the current prices.

Gary and I are not talking about the G3RUH 9600 bps modem design which
is currently the best commericially available modem for 9600 and
is available from Kantronics and PacComm. I believe it is called the
NB-96. James has done a beautiful job on this. It is the only
commercially available full duplex 9600 bps direct FSK ham modem.

(Is that enough adjectives or what?)

> The main thing you may need is a "mode J" filter to keep the 2 meter
> signal and it's harmonics out of the converter. Spectrum International
>
> Gary KE4ZV

I couldn't agree more. They are simple to construct and easy to tune.
One is especially desirable if you wish to try omni's. Do not expect to have
good luck with the omni's for at least a month. We just released the BBS on
the microsats and they are extremely oversubscribed. Gary and I contend
for the uplink at least twice a day! An omni station will work with the
microsats after the AO-13 boys and girls quit using 1 Kw eirp (or more).
I strongly believe that it takes more work to make an omni station work
but considerably less money. You simply must do everything right.
No desense from the 2 meter transmitter can be tolerated. A good preamp,
that doesn't collapse from proximity to the 2 meter transmitter is required.
Your deviation must be about 3 Khz. It is amazing to me out much better
the throughput is into the Microsats with 3 Khz deviation than you get
from 5 Khz. The filters are a little tight for the beginning and ending
of the orbit if you are not tuning your uplink to compensate for doppler.
The phase group delay at the edges is worse than we desired. Get away
from the edges and the filters are beautiful. The receivers in the Microsats
are especially sensitive to overdeviation. If you are digipeating through
the satellites, you can sometimes see two packets from you when you only
sent one. If this occurs very often, you are overdeviating. I run my
`mike gain' or modem output level at a setting so that when monitoring
my signal on another receiver, it sounds a little weak in audio. You will
not be weak at the satellite if you do this. Remember this is a carrier,
and you are modulating the frequency with Manchestered NRZI data. In
a correctly designed FM tranmitter, there is little or not AM modulation.
Since I regularly load code to the spacecraft, I have a monster uplink,
which I cut back to 8 watts to my gain antenna when I am not loading code.
This works out to be about 100 W eirp. Even this is too much.
After I cut back the deviation, I have yet to see one of my packets doubled
or the spacecraft respond that it heard me on the wrong channel. (It does
this inside the response to bootloader commands).

Attention please!

I still have trouble getting stuff in past the folks who refuse to look
and listen to see if the bird is operating or being loaded.

>ROM replacement. I wouldn't bother with the multimode wonder boxes. The
>compromises inherent in a do everything box mean that they do nothing
>particularly well. Also, the external modems we are talking about are
>specifically designed to interface with the TNC2 and tying them to one

Most TNC's running later versions of the ROM have KISS built into them. All one needs do is to say KISS ON. In some tnc's, this must be followed by a restart. To get out of kiss mode, a special command string must be sent to the TNC (KISS command 255) which will return the box to regular operation.

As for `do all boxes' being comprimises, with the PK-232 you are correct, as well as MFJ 1278 and KAM. Let's consider the PK-232 since you mentioned. it. The use of 200 Hz shift on baudot is an example and the noise performance of the Baudot demod suffers from the use of the BEL-103 receiver filters in a filter / slicer discriminator. Hooking up the external modems to this is a real pain as well. However, with the new DSP style `do all boxes' I can assure this is an incorrect statement. The baudot modem I just finished for the DSP-2232/1232 outperforms any I have tried and the PSK modem for PACSAT is second to none. The AO-13 demod copies reliably through spin mod fades and I use it daily to talk AMTOR and to UO-14 using the G3RUH 9600 bps modem. All are within 0.1 dB of theoretical performance. The day of the do all boxes being comprimises are almost over. There are things these units cannot, and will not do. 56 Kbps is completely out of their range at this time. The analog front ends, made up of programmable filters, are incapable of being tuned up to running with a 100 Khz bandwidth signal. Indeed, the A/D's will not run faster than 100 Khz. TAPR/AMSAT has finished its design and I have a Beta board to port the modems I have done for the TMS320C10 board we began all this with to that board. Lyle wants this out the door now. So do I, if for no other reason than to stop people from wasting their money because of fancy ads for vaporware. If you want a cheaper alternative to the AEA box, and will settle for slightly less capable hardware and/or you want it to plug it into your PC, wait a little while for the TAPR/AMSAT board. If you want the do all multimode then the AEA is the current best bet. Don't ask me for shipping dates. Call AEA and TAPR.

Gary's advice in all other respects is good and he is a very active user of the birds (I get to see the log files ;-).

4721. Crossed Field Antennas (long; for nerds only)

Newsgroup: rec.ham-radio
Date: 1990-12-28 21:19:02 UTC
From: kchen@Apple.COM
Message-ID: <47621@apple.Apple.COM>
Source record: 4830

Just when you think it is safe to go back in the water...
Just when you think the Crossed Field Aerial has gone the path of
Cold Nuclear Fusion...

Hately (GM3HAT) and gang has another article on the CFA in the
December issue of Wireless World! (Hey, Paul Nix, Ron Todd, and
others, are you reading this? :-) :-)

For those who have not been following the CFA since April 1989,
the CFA is based on separately generating the E and the H fields
using different antenna elements and assume that E x H to form
the Poynting vector just "happens" through mathematics. (All
classical notion of an antenna have the same piece of metal, e.g.,
a 1/2 wave dipole, generating both the E and H fields.)

Those who passed their tests by memorizing the FCC question pool
can hit "n" now. You can't really buy a working CFA from HRO yet.
:-) :-)

The Hately gang has apparently gone to a monopole-like configuration
of the CFA. Imagine the original symmetrical CFA. Chop it into
two equal halves, throw away one half and place the remaining half
over a ground plane.

Now get this: the ground plane is only 1 metre square at HF (I nearly
fell off of my chair :-).

Their reason for preferring this configuration is because they claim
that ground reflections would cancel out signals from the opposite
set of elements.

Another thing mentioned is how critical the phasing between the
E-cylinder and the D-plate are. So, I gather that the antenna itself
may be broadband, but the phasing unit is not. Nevertheless, they
showed a Smith chart plot of the impedance at the transmitting end
of the phasing unit that looks like it would translate to a VSWR of
less than 1.2:1 across the entire 15m phone band. Not bad. I can
live with that. They also mentioned that you can get 1.5:1 across
the entire 80m band.

There are sketches and photos of the new CFAs, but no diagram of the
phasing unit. The phasing unit is described, though, as a power
splitter that feeds equal power to the E-cylinder and D-plate with
an advance of 45 degrees in one case and retarding 45 degrees in the
other. They seem to claim that you only need to get to 45 degrees
to within a degree or two.

The authors also made some claims about the size of the "inteaction zone" where the Poynting vector synthesis takes place. They also modeled a 1/2 wave dipole the same way to show where it's "interaction zone" is (i.e., where the E and H of the dipole are "properly" phased) and claim that that is where the 1/2 wave dipole really puts out it's "stuff." From this, they claim that since the CFA provides a small source wavefront, that very small reflectors (1.5m dish at 21 MHz) can provide both gain and front-to-back, and believe that the old paradigm of requiring reflectors to be the size of a waveLENGTH be changed to requiring it be the size of a waveFRONT, instead.

Now, the claim is (otherwise it would violate the reciprocity theorem, now, wouldn't it? and they would have to invent new Physics; not that they have not already!) that the thing works just as well as a receiving antenna. What I don't get is: how the heck can you get more that a 6 dB improvement over each of the two chunks of metal (one is a disc 40 cm in diameter; the other is a cylinder 20 cm in diameter and 25 cm tall) by themselves. Each of those chunks hardly constitutes an element with a decent aperture area. An extreme case of the "supergain" condition for antenna arrays?

Well, break-through or snake-oil? You decide by reading the article yourself. Wireless World is *always* worth reading, in any case. Just don't flame (shoot) *this* messenger! Anyway, watch for fireworks in the Letter to the Editor in subsequent issues of Wireless World.

Cross-posted to: rec.ham-radio,rec.ham-radio.swap,rec.radio.shortwave

I am in need of a copy of The Boomless Quad article that appeared in CQ
mag. somewhere between April-June of 1981-1983. I am not sure of the date
exactly but I am sure it was in CQ because I built it some years ago.
If anyone has the issue in question, I would like to arrange for a copy
of it. I am particularly interested in the dimensions since I would like
to rebuild the elements and put it up. Please contact me via e-mail or
write me at: P.O.Box 1286 Lakewood, NJ 08701
AMPR: KA2RAF@NN2Z.NJ.USA
I am willing to pay any expenses for the copying/postage
Thanks very much, 73 de Chris

4723. PRO-2006 Modifications (Thanks!)

Newsgroup: rec.ham-radio
Date: 1990-12-28 23:11:00 UTC
From: 812spg@SACEMNET.AF.MIL

Many thanks to those that posted or E-mailed instructions for PRO-2006 modifications (particularly Manwai and Paul). I have made the necessary modifications and everything works "as advertised"!

In case there are other PRO-2006 owners who might also be looking for the cellular restoration (and a scan/search speedup) modification, I've enclosed the instructions which I received via E-mail. These modifications are VERY simple and quick.

> Hello,

> I too just purchased a PRO-2006. That same day, I made the mods....
> It took all of 5 minutes....

> Remove the top 2 phillips screws in the back of the unit.
> Slide off the top cover.

> Locate two diodes... directly behind the "3" key on the keypad.

> The diodes are D502 and D503 (you'll notice an empty spot between them...
> which doesn't really make any sense since there is no gap in numbers
> between D502 and D503 ... but anyway...)

> Clipping D502 restores the cellular band.
> Clipping D503 increases scan speed by 16% to 15 and 30 channels per second.

> Have Fun.....
> Paul Kopp

> -------------
> This information was obtained from the October 1990 issue of Monitoring
> Times.

Once again, thanks to those that responded with the quick help!

>same, the equipment is even the same. :-)

Yes! As I and others have said before, experiences from countries that
do have no-code licenses, for many years now, show that this simply
doesn't happen. After a while, you will find that LIDs equally divided
in all license classes. A number of local people I would call 'difficult'
(nor does any other test, IMHO).
have a full ticket here. The code test doesn't make a difference.

What will change next year?
If the amateur literature printed by a ham union is representative
for the work done in that country, then I guess UHF/SHF activity
will go way up. That is a Good Thing.

What will turn people away is a negative attitude. If you have a problem
with certain people, just QSY and keep everybody happy. Fortunately, there
is still enough frequency space left to do that. Even, you American people
still have a big allocation advantage.

Getting a whole flood of new people will put some pressure on the patience
of everybody.
Just wellcome the new people with a positive attitude, friendly point them to
the operation errors they make (like you made them in your first QSO),
and after a while you will find out that there are many people
for who you're glad they joined the radio service.

Real hams don't get mad at somebody with a bad fist. They will try to make
the code of that person better. The same thing applies here.

Best wishes for 1991! 73,

Geert Jan PE1HZG

> In article <X3ouu2w163w@phoenix.com> I write:
> >that there are few, if any, people who are payed to post to the net, and
> ^^^^^
> Could you possibly mean *paid*?

One of the dictionaries I have lists "payed" as an obsolete spelling
for "paid". Obsolete, as in old, not wrong.

Are you telling me that you have so much trouble with anything that
is not spelled exactly as you want to see it that you actually had
trouble understanding what I wrote? Is it not completely clear from the
context of the sentence what I meant (ignoring the fact that "payed" is
a valid spelling)?

> I also correct the spelling and grammar in my boss's memos and repost
> them. He loves me. :-)

Your boss's secretary should be doing this for corporate memos.
Corporate memos are the formal written communication of the company. If
you are altering memos over your boss's signature you are forging
corporate communications. It is lucky your boss loves you -- if he
didn't he would fire you. I would.

> Seriously, it only takes a moment to run your article through the
> spell checker before exposing it to the world.

Seriously, you have no idea how long it takes to do something here.
Why are you are qualified to tell me how hard or easy it is to do
something? Do you actually think every place in the world is just like
where you are, and has the same utilities that talk to each other in the
same way?

Please enlighten me on "THE spell checker". Did you mean "A spell
checker", or do you not know there are many different ones? Oops, sorry,
you have only one, so there must BE only one.

> If your writing habits are untidy, muddled, and indicative of a poor
> education, then your ideas are also suspect. This may not be fair, but
> it is the way it is.

Gee, just a second ago, you say how easy it is to spell check
everything. It seems that good spelling is more a case of owning a spell
checker than of a good education. Do you really mean you judge people's
ideas by whether they have a spell checker or not? Sounds like a pretty
stupid criterion to me.

This whole chain is stupid. It is stupid to waste the net bandwidth on nit picking spelling and grammer flames, unless there is a real problem in understanding the message. In all the time I have been reading the net, I have seen only ONE message that was in such unusual English that I could not decipher it. And even then, it does not deserve a flame.

Flaming someone about one misspelled word is just an attempt to prove to the net how smart you are and how stupid the misspeller is. It does not belong on an international network, and it certainly should not depend on how "ethnic" someone's name is. If you want to correct someone, do it by mail. You lose the "everyone look how smart I am" feature of the public flame, but you save the bandwidth.

If you want to continue to judge people by their ownership of a spell checker, or their name, I cannot stop you. Just don't demonstrate your mental superiority by flaming spelling errors. Now, let's stop all this worrying about how things are spelled or slips in grammer and get back to ham radio things.

KING RICHARD: "Come, bustle, bustle; caparison my horse;
Call up Lord Stanley, bid him bring his power."
Richard III, William Shakespeare ACT5 SC3

<And, no, caparison is spelled correctly. Look it up, you'll remember it longer.>

4726. Amateur Radio Callsign on 11M; was: 10 meter rig recommendation?

I had the occasion once in connection with a radio club public service event to ask the FCC about the use of tactical callsigns. The answer was, "As long as you ID by the book every ten minutes, we don't care what you call yourselves in between." During the conversation I casually mentioned that a club member used his ham call as a CB 'handle' when travelling. His answer was, "Since hams use callsigns interchangeably as personal names, that makes perfect sense to me." He added a comment to the effect that if the FCC gave a good gosh darn how people ID'ed on CB, they'd still be issuing callsigns.

1. I wish someone would take a survey to put accurate numbers on it, but I would guess that the OVERWHELMING majority of ARRL 'members' think of it as subscribing to QST and dismiss the organizational stuff as trivial.

2. People don't bash the ARRL for no reason. People bash the ARRL because it has for decades maintained an unblemished record for screwing up. They have resisted every improvement or advance to come along until after it was obvious that they were the last holdouts.

3. People don't join for a variety of reasons. Mine is I can't afford $30 a year for a magazine subscription.

As quoted from <1990Dec28.021435.11795@quest.UUCP> by ssb@quest.UUCP (Scott Sheldon Bertilson):
+---------------
| I've hacked a little on a version of NOS that Anders Klemets ported
| to System V UNIX. It uses shared memory and semaphores. Each
> ...
| overhead of synchronization using semaphores does a good job of
| gobbling up substantially more than a 10 MHz 68010 (my AT&T 3B1).
| I made a change to interlock using a test-and-set instruction
| on some shared memory before trying to get a major semaphore..it
| increased the efficiency of the package enough so that it
| is reasonably snappy, but I've had problems with synchronization
| not working properly, so I can't call it a success.
+---------------

I'm working on a complete reimplementation using Streams for SVR3. It is based on raw Streams, not the NSL, so it should work on any System V that has Streams support --- and some that claim not to, like Xenix 2.3.x without the appropriate network package. (I'm doing this under Xenix 2.3.3.) Of course, this won't help on a 3B1, which is SVR1 in the kernel.

(Actually, I'm still trying to decide how much I should do at the Streams level --- should I simply arrange for local sockets and use ordinary programs to do the real work, or put AX.25, NET/ROM, and TCP/IP in Streams modules and have the far end be selectable between a "bidirectional Streams pipe" and a real Streams tty driver? The problem with the latter is that it isn't particularly easy to implement something like NOS's "ax25 route add" command.)

SB SPACE @ ALLBBS < KD2BD $SPC1231
* SpaceNews 31-Dec-90 *

Bulletin ID: $SPC1231

=========
SpaceNews
=========

MONDAY DECEMBER 31, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* UoSAT NEWS *
==============
The launch of six microsatellites designed and built by dedicated amateur
radio operators from around the world was the most significant amateur
satellite news event in history. These six microsats flew as secondary
payloads on the European Space Agency's V-35 mission on 21-Jan-90.
Twelve minutes after liftoff, the Ariane launch vehicle placed these six
satellites into Earth orbit. UoSAT-3 and UoSAT-4 alone carried a total
of 9 microprocessors and 5000 kilobytes of RAM. That's more computing
power than had ever been launched by one rocket!

UoSAT-3 (OSCAR-14) carries a 16-bit embedded microprocessor controller
with 4.5 megabytes of RAM. UoSAT-4 (OSCAR-15) carries the first
Transputer parallel-processing microprocessors in space. UoSAT-3 is
currently being used to test new "PACSAT" communications software.
UoSAT-3's PCE uses a multi-tasking operating system created by Quadron,
Inc., which was specifically designed for communications intensive
systems.

UoSAT-4 (OSCAR-15) carries three microprocessors and a CCD Earth imaging
camera. Parallel processing available on the spacecraft will provide
high-speed compression of camera images. Tests of radiation tolerance
of the Transputer chips used will also be made.

* ITALIAN MICROSAT *
====================
Work continues in Italy on a new microsat amateur satellite.
During the first week of December, the transmitter module, BCR module
and CPU were all integrated and the PHT software was run succesfully,
controlling each different module. The PSK transmitter has been
tested at varous power settings, showing excellent linearity and
the telemetry frames has been received by many stations in the 50 km

radius of Rodano (Italy), where the engineering unit of the spacecraft
is being integrated. A completed unit is expected to be ready by the
end of Janaury after all tests are complete.

* BADR-1 DECAYS *
==========
BADR-1, a Pakistani satellite launched by the People's Republic of China
earlier this year, decayed in the Earth's atmosphere between 08-Dec-90
and 09-Dec-90. BADR-1 transmitted telemetry using an FM carrier in the
2-meter amateur radio band on frequencies of 144.030 and 145.825 MHz.
It was never determined why this spacecraft used amateur radio frequencies
for its downlink of telemetry since it clearly was not an amateur satellite.

4733. Can an Icom 4AT be modified for 450 Mhz ?

Newsgroup: rec.ham-radio
Date: 1990-12-29 06:06:23 UTC
From: slr@trixie.caltech.edu
Message-ID: <1990Dec29.060623.16997@nntp-server.caltech.edu>
Source record: 4843

I have an old Icom 4AT which has been collecting dust for several
years now (remember when radios had thumbwheel switches :-).

The production company I work for uses low-power 450 & 455 Mhz xmitters
as sort of a wireless intercom. I was wondering if there's a way to
easily shift everything "up" by 10 Mhz and have the Icom cover 450-460 Mhz
instead of 440 - 450 Mhz.

Please, I'll just be using it for reception so no flames about
FCC Type acceptance :-).

On a related note, I missed the ALLMODs post that was here awhile back; Is it
FTPable ? I checked Simtel-20 and couldn't find it.

4734. Will the codless license save ham radio (ARRL BASHING)

Newsgroup: rec.ham-radio
Date: 1990-12-29 07:01:35 UTC
From: flash@lopez.UUCP
Message-ID: <1990Dec29.070135.12514@lopez.UUCP>
Source record: 4846

After listening to all the belly aching about the codeless license, I decided it is time for the Eccentric Old Hippie to toss in his dos centavos.

It seems that even the opposing sides in the 14.313 war are unified in their hate for the idea of a codeless license, and are bemoaning WHAT WILL BECOME OF HAM RADIO (Hawr hawr just listen to 14.313 for a few days and you will realize it can not get worse than THAT)....

I think the FCC is one heck of a lot smarter than those old rickity coots at ARRL. The code free license that ARRL proposed would have brought in NO ONE. Plain and simple, that ticket had no value, and the FCC is wise enough to see that. Here are these grinchy coots wanting to hang on to all the "good stuff" like 2 meters for themselves.

WHAT ON EARTH FOR? Maybe there is a lot of fascinating 2meter discussions where YOU live, but my experience is that NEW BLOOD is NEEDED, and without this transfusion, the patient is gonna die.

I have a 2 meter all mode radio. I can tune it from one end to the other most of the day and hear NOTHING. Granted I live in the hinterlands, but I got this radio for $100 (some folks say I stole it from the other op) because the guy who had it could find no one to talk to. HE LIVES IN CHICAGO.

I have two friends who I work on this radio SIMPLEX. I guess that makes it worth the $100.

I also have a CB. (EEEEEEEEEEEEEK) On there I talk to about 6 very conversant folks about all sorts of fascinating topics. We have talked for HOURS AND HOURS on 27275. For at least three years, I have been pestering them to get ham tickets. They all have scanners and shortwaves and they listen to me talk to my ham friends, and also follow some of the more off the wall nets that I am a member of. They find it interesting, but none of them ever got sufficiently motovated.

Until now.

One of the group has already stated that come february he will be taking the plunge. I am figuring that once HE does, several of the others in the 27.275 group will also join in (There are THREE of us in the group that are already hams, but find the CB group more handy)

When I was a KID I thought the ARRL was great. They provided me the study guides, and back then QST was something a person did not need a bank loan to get.

I dropped out of ARRL when INCENTIVE LICENSING came about. I think NOTHING destroyed ham radio like INCENTIVE LICENSING DID. If you look at the figures I will wager that the decline in ham radio happened RIGHT THEN and there.

The new tech license will go a long way toward making up for the stupidity that caused the decline in ham radio activity.

I think it is time we old timers wake up and smell the coffee. I am in my 40's and I am the youngest member of most of the nets I am on. I used to remember in the 50's and 60's always hearing high school and college age kids on the ham bands. I don't think there is anyone younger than 35 on the local ham bands, and I do not recall hearing very many youthful voices on 20 40 or 75 either.

My Code Key is still connected, and I still use it... I sort of like the "tradition" of the original digital mode....

However, all those "usual" CW arguments started sounding very very stale to me 10 years ago; (You can use it in an emergency if your mic is broken) Hey lets make it manditory for DRIVERS also, so if they get stuck in a rollover in a valey, they can beep out a message.... (CW always gets through) packet gets through better, and it is ERROR FREE and you don't have to listen to a "lake erie swing" either.... etc. etc. etc. ad nausium.

I operate a fairly popular BBS system, which is radio oriented. All our staff are radio nuts of one variety or another. I am personally going to develop an on line study system based upon the new code pool. It will feature tutorials, an on line test, with help on the questions you missed.

I want to personally elmer in a SLEW of new ops, and so should the rest of you.

At least here on USENET, there has not been the sour grapes doom and gloom griping.

"Ham radio will become like CB"

Well I tell ya folks. Listen to 14.313 and then come to Marquette Michigan and tune in 27.275. Compare the two. Then say "Boy would it ever be a good thing if it *DID*"

RTTY DX Notes 1of3 12/28/90

RTTY DX Notes for week ending 28th December 1990
BID: $RTDX1228
Part 1 of 3.

So that was Christmas. We hope that you all had a very happy, joyous
and loving time with your families . . . and so to the New Year. May
it be peaceful, prosperous and healthy, and hope it will be better
than the years that have passed. We would like to see all that you
have wished for come true, to yourself and your friends. For myself,
i wish for a packet system that will handle traffic, irrespective of
length, which will not need to split it into small parcels. That will
save a lot of hassles. Have a happy year, chaps.

Our thanks this week go to DJ3IW and the Saar-Pfalz DX-Club Packet
Cluster, JA1BLV, OD5NG, TG9VT, UT5RP, VK2EG, W2JGR and the Tri-State
DX Packet Cluster Network. Thank you all for your help in the past
year, and may you all have a very happy 1991.

RTTY DX Notes 3of3 12/28/90

RTTY DX Notes for week ending 28th December 1990
BID: $RTDX1228B
Part 3 of 3.

QSL Information:

UL7LR says to QSL to Box 97, Dzhetygara, 459430, Kazakh, USSR.

KD7P/KH7 and KD7P/KH2 QSL via Bob Winters, MOU3, PO Box 8265, Dededo, Guam 96912-8265 USA, and not KA2XX as previously stated.

V31JV has a QSL manager of N4RNR, Silvio Marini, 880 Wynnehurst St, Pensacola, FL 32503-2440.

ZS9Z says to send his cards to ZS6BCR.

KP2N is managed by WA4WIP, Richard G. Tesar, 3903 Linwood St, Sarasota, FL 34232-3727.

ZD8BOB is still at Box 2, Ascension Island.

9M6/JH1ROJ says to QSL to his home address.

LX150 is a special call and will collect his cards from LX1OA.

Notes of Interest:

4X6UP says that 4Z80TA will operate for two months to celebrate the 80th anniversary of the municipality of Tel Aviv.

YA0RR (Afghanistan) expects to start operation from January 1, (after dinner). He will be there for three weeks and will spend at least 10 (ten) days on RTTY. Dima (UT5RP) will handle the RTTY QSL chores only. Don't send him CW or SSB cards.

FL5/XE1L (Luis) is on Mayrean Island in the Grenadines. He hopes for it to be clasified as a new country for DXCC when he submits his application. We are not sure if he has RTTY, but WFWL.

HF0POL is reported as being active from King George Island, but no reports of RTTY activity.

Swiss stations will be alowed to sign the HE prefix after January 1.

The OT prefix is the same as the ON prefix.

And a very happy New Year to you all.

GL DE DX1 (VK2SG) AT TG9VT.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU, or via the VK2AGE AMTOR
APLINK mailbox system.

ARRL BULLETIN 55 ARLB055
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 29, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

FCC announced on December 27 details of the new code free Technician
license. The license will carry full amateur privileges above 30
MHz. The new regulations are effective February 14, 1991. Current
licensees of all classes, including existing Technicians, will
neither gain nor lose privileges. The Novice license will continue
to be available to new applicants. Further information will appear
in the February issue of QST.

ARRL BULLETIN 56 ARLB056
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 29, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

FCC ruled on December 27 on exempting applicants with disabilities
from the 13 and 20 wpm Morse examinations. Applicants upgrading to
a license requiring these code levels may present to VEs
certification from a physician to be exempted from the CW
requirement. Only certification by doctors of medicine and
Osteopathy will be accepted. Applicants will also be required to
submit a release allowing FCC access to appropriate medical records.
The new regulations take effect February 14, 1991, though waivers of
13 and 20 wpm code tests are already available under similar
conditions. More information will appear in February QST.

4742. Home Escort (the portable electronic jail)

Newsgroup: rec.ham-radio
Date: 1990-12-29 18:09:16 UTC
From: onymouse@netcom.UUCP
Message-ID: <19591@netcom.UUCP>
Source record: 4848
Cross-posted to: sci.electronics,rec.ham-radio

I've recently heard some about the "Home Escort" device which is used
to keep track of convictees at home in lieu of putting them in jail.

The device consists of three parts: A leg bracelet worn by the convictee
(for lack of a better word), a radio device in a black box with two nine
inch whips on it which communicates with the bracelet and is attached to
a large console which is then connected to the phone line and makes a call
to a central station approximately every four hours at 300 baud.

Now, having seen the device, I am curious about what frequencies it uses to
communicate with the bracelet and how it talks to the central station, i.e.,
what it says to the station (and what the station says in return) and how.

Searching the low-power police freqs have so far turned up nothing from the
unit and I'm growing curiouser and curiouser about it.

BTW, the unit is made in Colorado and is FCC registered but that's all the
info I have been able to come up with.

Thanx,
jd

I have yet to talk to anyone for whom one of the Spectrum International filters has made a whit of difference. I have one here, and my experience has also been that it doesn't knock the desense down whatsoever. I went to a cavity filter which works great. Desense on Mode J seems to be dependent on a number of factors; some stations have problems, while others, using virtually identical equipment, have none. I'd recommend getting on the air first, and, if you have a desense problem on Mode J, then get yourself a 70cm cavity centered on the appropriate frequency.

I am interested in finding out technical information on beverage antennas.

I know that a beverage is a long wire, a few wavelengths long, about 6 or 7

inches above the ground. I think that the antenna is terminated somehow. I

heard that they are used in broadcast band dxing and that people have had

fantastic dx usine the antennas. I would be interested in any technical info-

rmation on beverages, construction, problems, etc. I would in addition like

to hear from people who have used beverages while dxing the am broadcast band.

Any information would be appreciated.

>testing for something relevant to the privilages granted.
>
>Airline pilots don't need to learn CW, but all the same the
>testing/education process seems to produce a reasonably competent breed!

When I took my pilot training in the Air Force, CW was a requirement. At least, you had to learn the characters. This was because the radio station identifiers were sent in Morse. One of the first things you learned in instrument flying was that you must be sure to identify the station you tuned to make sure you didn't fly to the wrong place. You did this by listening th the station identifiers.

There is no "airline pilot" exam as such. These folk get there after a long laborious grind, either through the military or through the progression from Student Pilot, Private Pilot, Commercial Pilot, and Airline Pilot. Each step carries with it certain experience requirements, as well as more intense medical and knowledge requirements. The Morse code is no more than just a part of the "early learning" process.

Nowadays, many (if not all) stations use voice identifiers, so there may not even be a requirement to learn the morse characters now.

I'm at a loss to understand this posting.
If I read it properly, Carl Hovey, who allegedly has
an Advanced license, and a rig, albeit one opf
of the highly touted and heavily advertised
Jap riceboxes (admittedly the Icom lines have
significantly better performance than the even
more heavily advertised Kenwoods, which in turn
are infinitely better than the recent Yaesu line,
which isn't saying much) and a couple of wire
antennas, which should work on a few bands.
[let's start a new sentence even though the last
one isn't especially complete.]
With the rig, which hopefully is operative, meaning that
it should receive "something" and likewise be able to
transmit "something" and a key or microphone, preferably
the former, as CW is the real HAM's mode, and some sort
of power, whether via battery, portable generator, or
maybe even Oregon Electric Co. or whatever outfit owns
the meter and the poles, etc. and the desire to make
contacts, I recommend:"

Said relative fire up the rig, tune around and find someone
calling "CQ" and answer same.
Or maybe even trying calling "CQ" himself and seeing what
happens.

I've done that for a couple of years, and it always seems
to work.

Or maybe somebody had misposted the item.
Rec.humor, perhaps.\?

Am I missing something?

73, etc.

If this is properly expanded, the answer can be found by reference
to the ARRL Handbook, l985 edition, page 13-2.
There is an extraneous reference to section 97.27 of the FCC rules, which
I admit I don't understand.

It's obvious that someone hasn't done his homework.

73 and happy new year.

It rather depends on your equipment's ills. If you have a 2 meter transmitter
or amplifier that puts out broadband noise, a common problem, a 2 meter
filter on the 2 meter output will do wonders while a cavity on the 70 cm
side won't help at all. If your problem is poor out of band strong signal
handling on the 70 cm receive side, then a 70 cm cavity will help. Some
setups need one, some the other, and some don't need anything at all.
When I was running an IC211 and an IC451A, I didn't need a filter at all.
With the current TS790A, I need both. :-(Anybody want a slightly used
TS790A? I'd love to trade up to an IC970 or an IC275, IC475 pair. :-)

>to hear from people who have used beverages while dxing the am broadcast band.
>Any information would be appreciated.

A beverage is a unidirectional antenna with gain for receiving only. It is
normally several wavelengths long and is mounted a few *feet* above the
ground. The far end is terminated by a 400-900 ohm resistor. The antenna
is unidirectional in the direction pointing toward the terminating resistor.
Mine are 1/4 mile spools of electric fence wire, mounted about eight feet
above the ground, attached to trees in the woods beyond my house. Four feet
would be a more ideal height with my soil conductivity, but I didn't want
deer to get tangled in the wires. The terminators are about 800 ohms in
my case. I have a rotary switch, with compass rose, setup to select the
proper antenna to feed an adjustable L network that feeds the receiver.

The theory behind the Beverage is somewhat controversial. The Beverage
seems to work similarly to a directional coupler. Signals arriving
from the direction of the receiver end couple to the antenna and are
dissipated in the terminating resistor at the far end. Signals received
from the direction of the termination go into the tuning network
and the receiver. Surprisingly high front to back ratios are achievable.
I have seen a more than 20db indicated signal strength change by switching
from one Beverage to another. The antenna's performance seems to fall off
rapidly above 4 Mhz. At MF and LF it is wonderful.

A few tips. To properly adjust the terminating resistor value, select a
station off the back of the antenna and have someone adjust the termination
for the best null. I use ordinary carbon pots as terminations. Don't
worry about the exact length of the antenna as long as it's more than
about eight wavelengths at the lowest frequency of interest. Ordinary
resonance effects seem to damp out beyond that length. The L network
should be designed to match 400-900 ohms to 50 ohms. Tune it for the
loudest signal. Install a knife switch at each end of the antenna so
that you can ground it when not in use. A 1/4 mile of wire picks up
a heck of a charge in an electrical storm. I've lost several terminating
pots due to failure to hike out and short the far ends to ground.

Not quite true. Although many of the VOR (navigation) stations do
have voice identifiers, other navigational aids such as ILS
(Instrument Landing System) nav-aids have only three and four
character morse code identifiers.

You are right that morse code, as such, is not a requirement for getting
a pilot's license, but a rudimentary knowledge of it is quite
helpful.

Some, and not even many, use voice. The main VOR's have voice on them,
but none of the NDB's or ILS's I know of do. And it is more important to
know which ILS you are receiving than the VOR. But both are important.

Pilots cheat, however. The charts include the dots and dashes along with
the letters. All you need to do is match the pattern.

Knowing Morse _did_ help on my Private Pilot checkride...

It's _real_ nice to be able to tune and identify a navaid while keeping my
eyes out of the cockpit, especially in Houston's busy terminal airspace.
Unlike Dube Todd, I've _never_ met a navaid with a voice ID.

I wouldn't mind having a Morse requirement for a pilot's license...

4759. Rumors of ARRL appeal on No-Code

Newsgroup: rec.ham-radio
Date: 1990-12-30 19:24:00 UTC
From: ps67@UMAIL.UMD.EDU
Message-ID: <9012301924.AA29750@umail.UMD.EDU>
Source record: 4866

Much has been said, mostly rumor, in this newsgroup about the ARRL's possible reaction to the recent FCC decision in PR Docket 90-55, Codeless License. Posters have accused the ARRL of being a "spoiler" on this issue and out of touch with "real" hams.

Perhaps we can get some meaningful information from somebody actually in the ARRL. Last evening, I attended a very nice dinner for alumni of the University of Maryland ARA. In attendance was Hugh Turnbull, W3ABC, Atlantic Division Director. Since there were at least 3 regular readers of rec.ham-radio (a.k.a. Info-Hams Digest) at the dinner, we asked him of the ARRL's possible response to the decision.

Hugh said that the ARRL still wanted to sit down with the full Report-and-Order and hash out precisely what differences exist between the original proposal and the one returned by the FCC. This is understandable, as they want to clear away the smoke of rumor and consider just what the impact of the new FCC regulations would mean.

Hugh DID say that the ARRL would be VERY reluctant to file an Appeal for Reconsideration, as to do so would cast the ARRL in the role of spoiler (maybe they aren't so out of touch after all???). What would motivate them to appeal would be a feeling that there were significant parts of the new regulations that would be EXTREMELY DAMAGING to amateur radio.

To extrapolate from what Hugh said, the decision on whether or not the ARRL would file an appeal would be on two points:

1. The impact of the additional privileges (i.e. 2m and 6m) that were not initially proposed.

2. Whether or not the new regulations would be EXTREMELY DAMAGING to amateur radio.

In previous conversations with Hugh, he expressed a concern over potential TVI problems between 6m and fringe-area Channel 2 reception. This was a key factor in the ARRL not asking the FCC for 6m privileges. There was also concern about excessive band loading on 2m.

Hugh says that comments on the issue have been split right down the middle. He is very concerned that the new regulations will divide amateur radio. He brought up 3 key goals of license restucturing, and why he felt that the new license might not be of significant impact:

1. An influx of new, quality hams. Any new restructuring in and of itself will not dramatically increase our ranks. No-Code is not a panacea and it should not be though of as such. Any serious effort to recruit new hams with this new license should be accompanied by an appropriate recruting/PR effort. VE's turning in their accredidation over disagreement with the new license will not achieve this goal.

2. A dramatic increase in amateurs on the UHF and Microwave bands, to prevent licensed and unlicensed encroachment on our bands from Part 15 devices, HDTV, cellular phone, satellite communications, etc. Giving away the lower VHF bands to new hams might give us the same band loading problems, only more so. The ARRL felt (whether you agree with it or not) that a 220-and-up license would force new hams to break new ground on the upper bands.

3. Acceptance and assimilation of these new hams into the mainstream of the hobby. Again, bitter divisiveness, shunning, old Tech's using a /C suffix, and other childish games will not make these new hams feel welcome. If this new license, as sensible and well though out as it may be, causes more divisiveness and infighting (possibly played out on the ham bands), then it may hurt more than help amateur radio.

As was stated previously, the stream of comments coming in to League officials on the issue have been split 50/50. If you write the ARRL, and I encourage you to do so, please consider the following in your letter:

1. Will 6m TVI be a problem? Why/Why not?

2. Will 2m band loading be a problem? Why/Why not?

3. What recruitment efforts do you and/or your club have in place to test, train, and accept these new hams?

4. What kind of impact will this new license have on use of the UHF and Microwave bands?

5. Will the new license cause a splitting of hams into code/no-code camps? What can you and/or your club do to make these hams feel welcome and smooth over ruffled feathers among existing hams?

Sorry this post is so long, but I had to get in all the information. Please don't flame/write me, flame/write the ARRL.

On December 13th, the FCC modified the requirements for the Technician Class license by dropping the code test. This bold move offers great hope to all of us who are deeply concerned with the possibility that amateur radio will one day soon be crushed under the weight of the spectrum needs of other services.

I was disturbed to note, however, that you were reported to be considering asking the FCC to reconsider this action to the extent of confining the new codeless Technicians to 222 mhz and up. I consider this most unwise for the following reasons:

One basic Technician Class license with one written exam + a CW endorsement for those who want to operate on HF would be easier and cheaper for the FCC to administer.

"Ghetto-izing" the codefree Technician Class licensees provides no regulatory or technological benefit. Rather, it serves only to codify social discrimination by preventing the newcomers from coming into contact with the majority of their fellow amateur operators.

Amateur radio constitutes the United States' first National Park of the Mind, and broad, open access to that public resource will provide intellectually stimulating and spiritually refreshing benefits to the nation that narrow, inhibitory access by the privileged few cannot. I believe that that is the basic reason the FCC made its decision.

Amateur radio's greatest contributions to the state of the art occurred during the period of its early history when it was not straight-jacketed by complex regulations and licensing structures not based on compelling need. Preventing or inhibiting the freest possible exploration of the National Park of the Mind consistent with conserving its meaningful existence would tend toward reducing it to the site for historical tableaux similar to those re-enactments of medieval jousting.

There is no compelling need for creating your proposed codefree ghetto. Therefore, any request for reconsideration will doubtlessly be rejected out of hand. The only result of a Petition for Reconsideration will be to make the League look foolish.

Moreover, since the new codefree amateurs are going to revitalize the future of ham radio, resentment against the organization that attempted to cause part of the original promise to be withdrawn would no doubt result in very few of them joining the League, which would very likely become little more than the custodians for its Antique Wireless Museum.

To summarize, it's a dumb idea.

Speaking as one with muscular dystrophy, I find your total insensitivity to be objectionable and offensive in the extreme.

And to think, your callsign indicates that you are one of these highly superior Extra Class licensees. You, my friend, are a living example of what we've been saying here - learning code is not a measure of intelligence or education.

Indeed, I'm beginning to wonder if the opposite may be true. It is a recognized phenomenon of psychology that people with certain severe brain disorders can be taught to perform simple mechanical skills with a high degree of proficiency. The theory, I guess, is that higher order brain functioning does not help and may even hinder the accomplishment of skills that do not require reasoning ability. That would certainly explain you and your fellow Penn Wireless Association members.

>heard that they are used in broadcast band dxing and that people have had
>fantastic dx usine the antennas. I would be interested in any technical info-

The Beverage antenna was conceived decades ago as a transmitting
antenna (primarily) which provided a low angle, unidirectional pattern.
Ham radio books such as the ARRL Antenna Book will have more
information about this design. It appears to me to be a somewhat
specialized, dedicated purpose type antenna setup that wouldn't be
useful for dx reception from diverse directions. Also, an antenna
several wavelengths long at broadcast AM frequencies could begin to be
a mile in length.

The all time best AM broadcast band DX antenna would be an active loop
antenna located some distance from the house, electrical wires, etc.
The loop would of course be remotely rotatable. The gain of this setup
would be such that the baseline atmospheric noise it picked up on the
quietest night would just override the receiver's internal noise. The
long antenna you propose would tend to cause a receiver dynamic range
problem without any real DX benefit.

Personally, I use a homemade wideband active antenna located about 100
feet from my house. This does MF and SW through 30 mHz. For MF (AM
broadcast), it would be better if it weren't omnidirectional, but I was
too lazy to put a rotatable loop outside. It is very important at MF
to get away from noise sources.

Now if you want to talk FM DX, I got all sorts of specific ideas for
that (I'm chief engineer of KWSS-FM, San Jose, CA)!

4767. Opinions on Macintosh satellite programs?

Newsgroup: rec.ham-radio
Date: 1990-12-30 23:27:04 UTC
From: winter@apple.com
Message-ID: <47638@apple.Apple.COM>
Source record: 4874

Wigi, AL7IF, is having trouble posting to the net and asked me
to post a request for information on satellite tracking programs
for the Macintosh.

He's interested in both commercial and public-domain programs. I know
of a few (see list below), but I haven't actually tried them myself.
If you have any comments on the ones listed below or any others, please
post them for the good of the masses or send them directly to Wigi at
"wigi@tybalt.caltech.edu".

Thanks!

Patty

Macintosh satellite tracking programs:

QuikMac
AMSAT, PO Box 27, Washington, DC 20044. $40 for AMSAT
members; $50 for non-members. Requires Microsoft BASIC.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program.
Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015.
Send formatted 800K Macintosh disk with stamped, self-addressed
return disk mailer; or send SASE for source listing. Requires
Microsoft BASIC.

MacSat
BEK Developers, 1732 74th Circle NE, St. Petersburg, FL 33702.
$10.00

Satellite Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $59.95

Satellite Pro
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $99.95

Collections that include satellite programs:

MacNet
Public-domain programs (currently on nine disks) contributed by
Macintosh packet users. Includes test preparation, contest logging,
propagation prediction, satellite tracking, and amateur television.
John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH
03103. Send formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer. Contributions of public-domain
programs encouraged.

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc.
Microsoft BASIC required for many (but not all) of the programs.
Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716.
Send three formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer.

"Amateur Radio Software for Macintosh"
Extensive catalog including logging, Morse code, Novice, gray-line,
satellite tracking, contesting, packet, and CW programs.
ZCo Corporation, PO Box 3720, Nashua, NH 03061.

Amateur Radio #1
Contains satellite tracking, Morse code practice, Ohm's law calculator,
and pad design programs.
Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

Ham-oriented landline BBSs that may have satellite software:

MacScience BBS
Various ham-related applications, including antenna design,
propagation, WEFAX, packet, and Morse code. (408) 866-4933.

Digikron Systems BBS
Various ham-related applications, including logging, propagation,
Morse code, and packet. (408) 253-1309.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse
code applications. (301) 625-0817, 625-9482, and 625-9663.

N8EMR BBS
Various ham-related files, including packet, Morse code, DXing, and
contesting software; AMSAT bulletins; and several ham newsletters.
(614) 895-2553. Also available on AMPR.NET at 44.70.0.1.

RE:Macintosh satellite prog

HI WIGI,
I saw Patty's posting about the satellite programs and their
availability. I am using MacSat 1.1.3 and I bought it from

BEK Developers
1732 74th Circle NE
St. Petersburg, FL 33702.
for $10.00

I also down loaded an older version (MacSat 1.1) that is the same program
from the SIMTEL20 [PD3:<MACINTOSH.APPL>: MACSAT.SIT](wsmr-simtel20.army.mil
26.2.0.74) for FREE!! I'm sure that there are other sites that will allow
downloading). The only difference is the one I paid money for had a version
that also ran on the Mac II (made use of the co-processor) as well as a
version that ran on the 512KE and up (that's two programs for the price of
one). The purchased program also came with a manual that has pictures and
explanations of the various options. The free program comes with some docs
but for $10 it's hard to bear it.

I also got the Amateur Radio #1 from Kinetic Designs that had an earlier
version on it (MacSat 1.1).

If you have a 512KE, Plus, SE then you can't use the program that uses the
co-processor. The MacSat2 1.1.3 was written for the Mac II + SE30 machines.
The MacSat 1.1.3 was written for use on ALL machines above the FatMac (512K).

I have tested MacSat (both versions) output against the Mainframe and the
$10 MacSat is equal to the Mainframe's output. The speed of MacSat is much
slower (naturaly) but the data is close (down to one tenth of a second and
one tenth of a degree).

I hope this answers some or all your questions, give me a shout if you have
any more.

4772. Apartment Operation...

Newsgroup: rec.ham-radio
Date: 1990-12-31 03:20:04 UTC
From: zielke@duke.cs.duke.edu
Message-ID: <662613603@romeo.cs.duke.edu>
Source record: 4876

I have the misfortune of being a ham stuck in a basement apartment (half underground actually and two floors above) I have been trying to come up with some kind of radiator which does not extend out of the apartment (rules from the management).

The only thing which seems to be possible at this point is a dipole wound on a pole with some kind of matching network.

Thus, two questions:

1) Any other system which might work well
(I would like 20 meters but will live with 10)

2) Suggestions for a cheap or easy to build transmatch
which can handle the output from my Kenwood 820
(About 200 watts max)

Please mail me directly as I am trying to catch up on my newsgroups but it is quite a battle...

For those not familiar with the area, the southern point of Ontario jutting into Lake Erie is the southernmost part of Canada, several hundred miles south of many parts of the lower 48 states of the U.S. They call it their "Sun Porch". Pretty place. Rather like Ohio. [:-)

I was surprised to read that the ARRL is considering
opposing the new code free Technician license. This is
a really bad idea for at least two reasons:

1) This sounds like a way to eliminate what little good
will may remain between the bureaucrats of the FCC and
ham radio. The FCC plan gives us a useful code free license
class with little or no cost to the government. Cost is
everything to the government these days.

2) The idea is a basically a good one.

I've taught a number of Novice and Technician classes,
and I've seen first hand the loss of good potential
hams to the code. It seems like a lot of folks have
a lot of trouble with the code, and an almost equal
number have trouble with theory. Now I can get
the ones with theory problems on the air as novices,
and the code haters can go straight to tech. I am
sure that anyone who takes the time to learn the
```

theory to the technician level has more than a
casual interest in radio, and won't abuse the
our privileges. This will be really great for schools,
who can more easily justify "time on task" for study
of electronics than for study of an economically useless
skill like code.

I urge everyone to contact your ARRL director and urge
them to support the FCC code free proposal.

73,

Jim Howard, N4WBO @ N4HOG.VA.USA.NA

What kind of a person would not go through learning the code to become a ham radio operator? ...Certainly no one who we would want to see on the air....

Its easy as walking down your own hall to learn code... heck if I could do it _anyone_ could do it.

...Besides _I_ had to learn the *&^%$%# code, why give these wannabe newbies a break?

Can you immagine what kind of person will be drawn into this hobby of ours if the nocode techie license comes in, I can see it now the pirate CB bandblaster type screaming breaker 19 for a bear on the side.... The code has kept this kind of person out for 20 years. Lets keep it that way.

...I wont even *talk* to a guy who gets a no-code techie license, I know of no _real_ ham who would even bother with people of this ilk.

Though in places the above was deliberatly overstated, the feelings put into words above have seemed quite prevelant on this newsgroup since the news release by the ARRL and the FCC relating to the new no-code ham license. This is not to say that all of the users here have been this way, in fact there have been some downright gracious posters who say they will be welcoming those of us without code class licenses with open arms. To them I say, thank you.

To the others, please consider that many of the people you will be "forced to live with" in this new radio world are not the music broadcasting, foul mouthed band jammers you left on channel 20 of the CB. Many if not most probably want to add to the hobby or enhance themselves through it in one way or another.

I was very serious about getting my ham ticket about ten years ago. I worked very hard studying the theory, the laws, and the code. I found the (novice) theory to be a challenge, but certainly not oppressive, the laws to be a breeeeeze, and the code to be totally insurmountable. I did all the usual stuff including the tapes and the records. I studied books on 'how to pick up the code' that were reccomended by hams who should have known what they were speaking of. I even had a few people help me study the dits and dahhs for hours on end, and after six months of trying, I gave it up as something that my mind just wasnt receptive to. I believe that I was a very comitted student and I did honestly try the best I could to pick it up. The sad fact is

that some of us are more oriented to people or art or math while others find these subjects a waste of time and can't concieve of why anyone would spend the time with them.

Instead of becomming a ham, I was forced to be happy listening in on the short wave radio and a couple of scanners. I have learned a lot about dxing from this and no small amount about making and erecting antennas....so it isn't all for nothing.

Now that the no-code license has been proposed, I expect to finally receive that ticket that I tried so hard for years ago. I have a particular interest in disaster preparadness and emergency response. I have a proven ability in these areas and know from experience that I can maintain a calm reasoned thought process when in a true emergency situation. Like others I expect to enjoy the 2 meter rag chewing and the usual bs that most hams play with, but I also intend to give something back to the hobby that not only helps the local community, but can result in damn good press for the ham fraternity as well.

However..... if the vast majoity of the 'old guard' choose to dismiss those of us who are lucky enough to get our no-code tickets, without giving us a chance to learn the ropes and get mature enough in the hobby to give something back to it, you will have a self fulfilling prophecy. You will 'scare' away those who might care and could help the hobby out and be left only with that minority who don't give a damn anyway. I think we can all agree that this would be a travesty and might just bring down a great part of the hobby to the level of alt.flame.

Having said all of that I feel I can now climb down off of this lofty pearch of a soapbox and humbly ask a few questions.....

A) I have been away from the ham side of things for so long that I am even in a quandry as to what to look for as far as books on the subject. I suspect that ARRL still puts out quite a library, but I am more interested in something to help get the license that is less stilted in the ways (and pockets) of the ARRL. There was a set of books out several years ago that essentially took you through what you could expect to see on the exams and gave you a pretty good background on the exam and the possible questions. Do these still exist? Can you reccomend anything else that might be helpfull?

B) My wife and I have talked about her geting into this in a lesser way, mostly to help out with emergency traffic and to keep in touch when we are appart or separated because of an emergency. I vaguely remember something about family members working equipment in times of emergncy, but I can't be certain. Is there a way for her to legally use the radios either in tandem with me during emergency work, or by herself to contact me if we are sepparated due to natural disasters etc? She will probably get her own ticket too thanks to the dropping of the code requirement so this may become a moot point.

C) One of the big draws, asside from helping others, to the ham hobby
was the ability to talk across the country and overseas. Since this is
not going to be possible for me on the HF bands, have there been any
developments in the last ten years that could be of interest to me in
this regard? I understand that there is some sattelite stuff open to ham
operators, and I am currious about what it might cost to set up a shack
for transmission and reception in that area as well as anything else.

D) Keeping a budget in mind, if you had to start all over again buying
new equipment for your shack what would you consider buying. I am
interested in handhelds as well as base station style goodies. I will
not be installing mobile rigs in our vehicles sans the handhelds on the
next seat. :-) (Give me a starting place here folks...)

Thanks in advance for your help. If you feel the need to flame
do it by e-mail, if not then any other comments or suggestions you have
would be most welcome.

Charles

Well said, sir! Any radio amateurs who will not tolerate modernization
of the license requirements are digging the grave of the Amateur Radio
Service.

To put it bluntly,
(1) We are no longer training the Signal Corps for World War I;
(2) The FCC does not give us spectrum primarily to preserve traditions.

I use CW myself; it's a nice mode, but it's no longer the only mode
we've got. I sometimes think the no-code license would have been easier
to introduce in 1950 than in 1990; 40 years of ossification have set in,
and too many hams have gotten the idea that licenses are a matter of
tradition or simple drudgery rather than technical qualification!

The question I would put to those who continue to oppose no-code
(including, perhaps, some of the ARRL leadership) is this:
Will there ever be a time in the future when license requirements
are different from what they are now? Do we modernize, or do we
fossilize?

I thought about no-code for a long time before taking a position on the
issue. Apparently, this is a very rare practice; most people made up their
minds before they knew exactly what was proposed or why.

I came out only mildly in support of no-code, but I'm gradually turning into
a raving fanatical defender of the no-code license simply because the
things that are said *against* it are so dumb!

Welcome to amateur radio. Let me know if I can help. vy 73 de N4TMI

If you noticed, I mentioned that as I understand the farcial waiver business I'd have no big trouble getting a waiver myself. Of course I didn't - was about 30 years too soon getting the X.
What does Frank Spicer - totally blind and deaf, and no youngster either - thinkof it? Ask him. He EARNED his Extra.
Do you remember Clif Korne, K9EAB, now S.K., the ultra proficient ham in the iron lung? He didn't need a waiver; probably couldn't have got one because he could pass the test without.

The real answer is: It's true that -maybe- some handicapped persons can't pass the code test because of some physical failing. It also appears that many who have no claim to being "handicapped" can't pass the test. It's too damn bad that each and every one of us can't do everything. There are a hell of

a lot of things I can't do because of physical limitations.
And the whole thing started because Pres. Bush got a bug up his ass and sent a memo to FCC.

What credentials does the average MD or DO have for deciding whether you or I can't pass the CW test "because of ***"? Hell, most of them are sloppy about deciding who's qualified for a handicapped parking permit.

I will repeat: it's a farce. Is your muscular distrophy limiting you more than Frank Spicer's blindness/deafness? Or maybe K3KTH. I haven't heard or seen ofhim for a few years, but had the pleasure of meeting him often many years ago. Bill was, of course, wheelchair-bound; restrained because of his spastic condition. Intelligent? No, brilliant. He was able to send by foot, and passed the test because he wanted the ticket.

I expected - even hoped for - some >comments< on my posting. Let's have more.

Incidentally, about the no-code: It's an elegant solution; it should work.

73 and hny to all

4782. Re: Ground Plane for my CB antenna

Newsgroup: rec.ham-radio
Date: 1990-12-31 07:45:19 UTC
From: gpz@ESD.3Com.COM
Message-ID: <gpz.662629519@api>
Source record: 4895
Cross-posted to: rec.radio.shortwave,rec.ham-radio,sci.electronics

steven@ozonebbs.UUCP (Steven Rubin) writes:

+I want to put the antenna on my roof, but I am having trouble
+finding a good ground plane. The manager at Radio Shack suggest getting a
+peice of sheetmetal for a ground plane. How big should I make the sheet
+metal?

1. Yet Another Reason to Avoid Radio Shaft (YARTARS)
This radio shlak person, like most, is talking through
his hat. I can see the headlines now..._18-foot flying
saucer lands on house_. I can not imagine buying, let alone
installing, such a collossal piece of metal. Where does
radio slock find these incredibly dense people?

2. a. The bad news: the ground plane should be at least
a quarter-wavelength in radius, which, for 27 MHz,
is about...(slip, slip, slip)...107 inches.

b. The Good news: it doesn't have to be solid; in fact,
you can get away with three or four pieces of wire
instead.

Side view:

```
|
| (center conductor of coax connects to this)
|
|
------+------ ground plane (braid of coax connects to this)
```

Top view:

```
|
|
|
-----+-----
|
|
|
```

Sometimes people bend the ground plane radials downward, which raises
the feedpoint impedance of the antenna from ~30 ohms to something closer
to 50 ohms. This is desirable because the most if not all CBs are designed
to operate with a 50 ohm antenna impedance. Note that the radials do not
have to be stiff...they can be pieces of wire tied down at both ends.
They should be connected electrically in any case.

Base station antennas of this sort usually have a full-length quarter-wave vertical element, as opposed to a physically shorter one with a coil. What type of antenna are you currently using? I'm guessing it's a mobile antenna with a loading coil of some sort. If that is the case, you might be better off just buying a regular base station antenna as long as you are going to this much trouble, since the full-length antenna will perform somewhat better (how much better? well, maybe 36.438764356 percent).

Wow, it's a good thing I don't read rec.ham-radio, since there will most assuredly be 6.02E23 other replies all saying this same thing, or pointing out that a full-length antenna will really perform 36.438764357% better, or asking if the resulting antenna would be FCC type-accepted or would it be against the rules part 95.7863(a) paragraph 3 section t etc. etc. etc. :-)

Good luck!

~!paul

4783. A few new questions

Newsgroup: rec.ham-radio
Date: 1990-12-31 09:19:42 UTC
From: olson@bootsie.UUCP
Message-ID: <53@bootsie.UUCP>
Source record: 4898

Hi again! Happy newt ears, everybody!

I have a few questions, after some sleepless nights trying to read
the entire ARRL Handbook...

1. Is it legal to communicate via repeater in a band for which you are
not licensed? The specific example that I suspect will become a common
question is 2m->10m repeaters. Previously, there was no class of Ham
operator that was licensed for 2m but not 10m... but the codeless tech
cannot operate 10m. Can she operate 10m via the aforementioned repeater?

2. Can I sign up to take the Tech class _with_ code, fail the code, and get
a no-code tech license? This is a very enticing (win-win) scenario for me,
and would probably be an attractive option for a lot of the people
lured in by the promise of no-code (e.g., those that like a challenge
but don't like to _fail_ :-).

3. I'm confused about whether a repeater and/or phone patch can be run
without local direct control operator supervision. Are all those
repeaters out there really babysat all the time they're in use?
What about digipeaters and other packet radio stations?

4. Is it legal to make a repeater that changes its output frequency
via DTMF signals (and appropriate security codes a la phone patch)?

5. Anybody know of dialup BBS's about Ham Radio in the Boston Area?
I downloaded a list of Ham BBS's from SIMTEL-20, but both the ones in
Boston were no longer in operation at the listed numbers. If not,
(or if so), I could start one within a couple of months.

6. Would a 100W 10m Transmitter to an antenna, say, 100 feet away, damage
one of those full-coverage scanners? Would a 1KW Transmitter? 2m?
It just seems like that would generate a lot of energy at the antenna
of the scanner-- how much is too much?

Advancing you great thanks for your kind responses,

-Eric

Cross-posted to: rec.radio.shortwave,rec.ham-radio,sci.electronics

steven@ozonebbs.UUCP (Steven Rubin) writes:

>I am setting up a CB in my house, and I am having problems with a ground
>plane.

I had very good luck with a quarter wave (104") mobile whip mounted on
the roof of my house (secured to a short mast), with three (four would have
been better still) quarter wave (104") ground radials (#14 wire or thicker)
sloping down at about 30 degrees below horizontal.

The radials should be electrically connected to the "ground" connection at the
base of the antenna, and the far ends should not be touching or near to
anything conductive. I used nylon ropes to hold the radials in place, and
the radials/ropes became guys to support the structure as well! #14 or
heavier wire is best for the radials.

The antenna performed nicely with an SWR of 1.1:1 on all 47 channels.
(40 if you prefer not to count varactor magic) :->

Another friend did something similar with a center-loaded whip. The results
were acceptable, but not as good as I got with the long whip (not surprising).

Now, I was just imitating other working designs, without any really good
understanding of antenna theory, so there are undoubtedly things I could
have done better. Please do post, so we can all learn.

4785. Question on Hallicrafters SX-146 / neat AM radio trick / receivers

Newsgroup: rec.ham-radio
Date: 1990-12-31 10:38:40 UTC
From: kpc00@JUTS.ccc.amdahl.com
Message-ID: <KPC00.90Dec31023840@JUTS.ccc.amdahl.com>
Source record: 4893
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I don't subscribe here, but I have questions that I hope a kind reader
or two will be able to help answer for me.

1. I own a Hallicrafters SX-146 receiver, and I wonder:

o From a practical perspective, does it do anything that, say,
one of the new mini Sony receivers that costs one or two
hundred dollars doesn't do? It has all kinds of switches and
dials for sidebands and all, but I don't know whether they
have been superseded in the new receivers or not.

o Does it receive any frequencies that one of the new
receivers don't? Does it receive weaker transmissions?

o What kind of a resale value does it have? I have the manual
and schematics, and as I haven't used the receiver for several
years, and just moved into a very small apartment, I will
probably want to sell it. Would it be appropriate to ask on
rec.ham-radio.swap? (I won't unless somebody sends me email
and says it's OK.)

2. I used to take an old tube AM radio and attach a long coil of wire
to the tuning capacitor and get shortwave transmissions. I wonder:

o Can modern radios of any kind do this? I tried it on a new
GE AM radio and had no luck except for a CW-like transmission
that might have been from any frequency including the top end
of the AM spectrum.

o This, IMHO, is really neat! :-). (I got Canada and the
USSR, I think, and other countries.). Have others discovered
this? Could a similar trick be used to effect transmission?

3. I wonder about the the modern mini receivers:

o Do they have limiter circuits to prevent reception of
particular frequencies?

o Do they use jumpers or more permanent methods of limiting
frequencies that one can get? Is it a legal requirement?

4. I probably won't be getting one anytime soon, but if I do get a
mini receiver (the Hallicrafters is too big for me, believe it or
not), what type and/or brand do you recommend? I would want a small
receiver that receives lots of frequencies.

It would be wonderful if you could reply by email.

Thanks!

>side won't help at all.

Correct. My point was that of all the folks I've talked to with desense problems (which encompasses a wide variety of equipment configurations) I haven't found anyone for whom the *Spectrum* filter did any good. Lots of people have bought these things, only to throw them into their junkbox the next day; if yours helps out with Mode J desense, then you're definitely the exception.

4787. New Techs and CW Operators

Newsgroup: rec.ham-radio
Date: 1990-12-31 12:18:34 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9012311218.AA25202@cmr.ncsl.nist.gov>
Source record: 4894

Even though I opposed the no-code license, it seems very foolish to discourage the potential newcomers. Instead of driving them out, we should be doing all we can to ensure that the majority of the new hams are of the highest possible quality. No-code is here, it most surely is on 6 and 2, do what you can to get as many high quality newcomers as you can.

Since the FCC didn't buy my position that the new licensees should be located above 220 MHz (to supply a critical mass so that manufacturers would promote equipment for these bands), we're going to have to work much harder to retain our lightly-used microwave spectrum. (Yes, I know, they passed the same written test, they should have full VHF-and-up privileges.)

The assembled multitude might be interested in the following small display ad which appeared in the December 24 issue of "Broadcasting".

Source record: 4897

Ever wonder why after all the billions of dollars and countless man-hours spent on searching for extra-terrestrial RF signals that we've come up with NOTHING ! ? I don't have the answer either. However, one possiblitity is that if there are technically advanced societies out there who at one time used RF to communicate, for one reason or other they stopped. Perhaps they realized RF is a potential health hazard and power levels by law are either kept to a bare minimal or/and everything goes over cable (fiber optic or whatever other medium). Will a distant planet perceive of a "Voyager" spacecraft as an "Enemy Intruder" if it is mapping the planets surface from above by means "radar mapping" ? Perhaps they have reached the mental ability to communicate via telepathy. Perhaps they stopped transmitting a million years ago and they were only transmitting for a span of 500 years. If this was the case, we would have lost their "window" of time in our mear 50 or so years of listening. Perhaps we are the only one's around or the only planet using RF ? Perhaps they destroyed themselves in a CW vs. Phone ops war.
I'd be interested in hearing some of the Net Reader comments re: RF and Sci-Fi/ Sci-Fact.

4790. CAPACITORS, RESONNANT FREQUENCY, R7000 to NRD 525

Newsgroup: rec.ham-radio
Date: 1990-12-31 16:49:46 UTC
From: jl@newt.sbi.com
Message-ID: <410@newt.sbi.com>
Source record: 4901
Cross-posted to: rec.radio.shortwave,rec.ham-radio

THIS IS A TECHNICAL QUESTION
ABOUT CAPACITORS, RESONANT
FREQUENCIES AND IMPEDANCE

Equipment concerned: ICOM R7000, NRD 525

What I am doing:

I am connecting the 10.7 Mhz IF output from my ICOM R-7000 receiver
to my NRD 525 HF receiver. This is done so I can use the better
filtering and additional modes of the NRD on the VHF/UHF frequencies.
Because the 10.7 Mhz signal is carried on top of 9 V DC, I am using
a capacitor in series with the cable. I do not know the impedance of
the 10.7 Mhz IF output on the R7000 (ICOM does not either) but the
antenna input on the NRD is 50 Ohms.
The setup functions (I hear stuff) with a .001 uF capacitor but I would
like to have a better match:

- Have the circuit wire-capacitor resonant at 10.7 Mhz to get
the maximum current through and also act as a filter.
- Have the impedance matched at 50 Ohms.

In addition, I am also connecting the Audio output of the R7000 to the
50 Ohms input of the NRD to tune to SCA that are at 67 Khz and 92 Khz. A
capacitor in series would block any unwanted DC and also act as a filter.

- Have the circuit wire-capacitor resonant at 67 Khz to get
the maximum current through and also act as a filter. Same
for 92 Khz.
- Have the impedance matched at 50 Ohms.

Questions:

1- What is the formula that gives the resonant frequency of a capacitor?
The formula giving the resonant frequency of a circuit,
f=1/(2*PI*SQR(L*C)) lets me wonder what value I should take for L
Should it be the impedance of the coax (50 Ohms).
The ARRL Handbook has a table of resonant frequencies for capacitors
and specifies the length of the leads, but that table does not have
anything for 10.7 Mhz or 67 Khz or 92 Khz.

2- To try to match impedance to 50 Ohms I am using the formula
Xc=1/(2*PI*F*C) with Xc of 50 Ohms. This gives me a capacitor of
~ 300 pF for 10.7 Mhz (With a 52 Ohm coax it should really be 286 pF).
Is this approach correct or am I totally mixing up Apples and Oranges ?

3- Because I am building 3 cables (10.7 Mhz, 67 Khz, 92 Khz) and because
I want only those frequencies, I would like to have a high Q on the
capacitor acting as a filter. Is this possible to achieve ?
Note that these cables are used for reception only, therefore I do
not have to worry about power.

4- How can I match the Audio output of the R7000 (I think it is 150 Ohms)
to the 50 Ohms antenna input of the NRD 525 ?

I am more interested in the technical answers that someone stating "I use
a xxx uF capacitor and it works fine for me". I want to know how to make
it better.

Please reply to the net, as it may interest others.
Thanks.

4791. My last posting from this site (Philips)

Newsgroup: rec.ham-radio
Date: 1990-12-31 17:13:29 UTC
From: rfc@briar.Philips.Com
Message-ID: <116450@philabs.Philips.Com>
Source record: 4926
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.radio.shortwave,sci.space,sci.astro,sci.space.shuttle,comp.sys.atari.8bit,soc.culture.china,alt.tv.simpsons

Goodbye. Philips is having layoffs, and they did it at my site. Only reason that I haven't got told officially yet is that I'm out sick on disability (eye trouble). But several reliable sources tell me that I'm to be canned when I return to work (Jan 2). My normal remote dial-up computer access code no longer works, I'm using a friend's code, at his house. Don't think they can tell whose.

The kind of work I did is television R&D, including HDTV (high defination TV, regular NTSC television, developing patents (I have 11) in this field. Also have done DSP, & high speed digital logic design, up to 114MHz clock speeds. I posted my resume on misc.jobs.resumes Or call me up and I'll mail anyone interested a copy of it, and a list of my patents. Will consider anywhere in USA. Corporations, and colleges (someone at a college called me about 2 weeks ago, call again).
Also give my name and number to any and all headhunters.

Robert Casey Amateur radio WA2ISE
855 Oradell Ave Amateur radio packet: WA2ISE@KD6TH
Oradell, NJ 07649
201-261-4066

Don't try to use e-mail, as Philips is going to delete my computer account the day I get officially canned. I don't expect to be able to log on again.

This is the dark side of American life. But getting layed off is better than getting killed in or near Tianamen Square.

4792. Artificial Grounds

Newsgroup: rec.ham-radio
Date: 1990-12-31 17:30:39 UTC
From: kchen@Apple.COM
Message-ID: <47653@apple.Apple.COM>
Source record: 4900

In one of my more idle moments, I thought of a fun thing to try that could be useful to other folks out there that needs a decent RF ground at the spur of the moment, and have a spare ANTENNA TUNER (no kidding) handy.

It turns out that most antenna tuners out there would work as a ready made Artificial Ground (AG). An AG is a series LC tuned circuit that has an RF current probe. A long ground wire is passed through the series LC in the AG before it is connected to your rig's chassis, so that the ground wire's reactance can be tuned out. You tune for maximum RF current.

Well, if you look at the schematics of your antenna tuner, you may find that there is a combination of an L and a C in series between a connector and ground! My AEA AT-300 did (this became a spare tuner when I got a Ten-Tec 238 tuner that did a better job, with it's roller inductor, for my antenna experiments. The AEA is sort of OK, but...).

I connected the ground (20' to a cold water pipe) to the center conductor of the "Transmitter" connector and strap the chassis of the AEA tuner to my rig's chassis. That is all there is to it. The power meter on AEA senses just the right current and all.

If you think about it, almost any topology commonly used in antenna tuners with have an L and a C in series between a connector and ground. A two-C-one-L pi network does, a two-C-one-L T network does and, like the AEA unit, a two-L-one-C T network does.

Not the cheapest Artificial Ground but it may be the easiest way for a lazy (I am the first to admit I am one) person to experiment with artificial counterpoises.

73 and have a fun '91, folks,

>privileges. There was also concern about excessive band loading on
>2m.
>
>Hugh says that comments on the issue have been split right down the
>middle. He is very concerned that the new regulations will divide
>amateur radio. He brought up 3 key goals of license restucturing, and
>why he felt that the new license might not be of significant
>impact:
>
>1. An influx of new, quality hams. Any new restructuring in and of
>itself will not dramatically increase our ranks. No-Code is not a panacea
>and it should not be though of as such. Any serious effort to recruit new
>hams with this new license should be accompanied by an appropriate
>recruting/PR effort. VE's turning in their accredidation over disagreement
>with the new license will not achieve this goal.

A reasonable view.

>2. A dramatic increase in amateurs on the UHF and Microwave bands,
>to prevent licensed and unlicensed encroachment on our bands from Part 15
>devices, HDTV, cellular phone, satellite communications, etc. Giving
>away the lower VHF bands to new hams might give us the same band
>loading problems, only more so. The ARRL felt (whether you agree with
>it or not) that a 220-and-up license would force new hams to break new
>ground on the upper bands.

A dramatic increase in activity on UHF+ must await a critical mass of
users. These users should be socialized to amateur radio operations
rather than being left to invent a new service on their own. Thus
"ghettoizing" the newcomer is not a good way to achieve critical
mass. By mixing the newcomers with the old timers at the "watering hole"
on two meters at first, the end result will be a gradual migration
of *one* culture to the higher bands.

>3. Acceptance and assimilation of these new hams into the mainstream
>of the hobby. Again, bitter divisiveness, shunning, old Tech's using
>a /C suffix, and other childish games will not make these new hams feel
>welcome. If this new license, as sensible and well though out as it may be,
>causes more divisiveness and infighting (possibly played out on the ham

>bands), then it may hurt more than help amateur radio.

This type of "one upsmanship" attitude of "I'm better than you" is already prevalent on the ham bands and has been since at least 1968. The General looks down on the Tech (he's not a real ham because he can't work 20 meters). The Advanced looks down on the General and the Extra lords it over them all. Removing the Morse requirement from a class that rarely uses it anyway should not make the caste system much worse.

>As was stated previously, the stream of comments coming in to League
>officials on the issue have been split 50/50. If you write the ARRL, and I
>encourage you to do so, please consider the following in your letter:
>
>1. Will 6m TVI be a problem? Why/Why not?

No. Reasons. Six is not presently a very popular band. There is little commercial equipment available for Six. Our ranks are not likely to soon explode with Six meter DXers. Our new techs are likely to follow the herd and emulate current tech operating habits, at least until they gain some experience. Since the only difference between current Techs and the new Techs is 5 wpm Morse, and knowledge of Morse doesn't help one solve TVI problems, the new Techs should cause no more problems than the current Techs do. Cable TV.

>2. Will 2m band loading be a problem? Why/Why not?

No. First of all, 2 meters is not overloaded now with anything but mostly silent repeaters. Operating patterns may have to change somewhat. The luxury of one repeater for every two amateurs may have to give way. And some users may wish to permanently migrate to UHF in an attempt to maintain that ratio. But, the band is in no danger of congestive collapse.

>3. What recruitment efforts do you and/or your club have in place to
>test, train, and accept these new hams?

The club(s) that I belong to intend to welcome these people with open arms. Many members are already sounding out likely prospects and our clubs intend to modify our present training classes to include the codeless technicians. We hope to boost our middle school program with the codeless tech option.

>4. What kind of impact will this new license have on use of the UHF
>and Microwave bands?

I expect the impact to be modest at first. We need to build a critical mass of socialized users before interesting services will develop on the upper bands. A combination of the experimental interests of the new licensees and increasing pressure on traditional hams operating primarily at 2 meters will slowly build the critical mass to make the higher bands take off.

>5. Will the new license cause a splitting of hams into code/no-code
>camps? What can you and/or your club do to make these hams feel

>welcome and smooth over ruffled feathers among existing hams?

There are bound to be some traditional hams who will resent the newcomers, much the same way they resent current newcomers. Trying to be inclusive rather than exclusive should reduce the fragmentation that plagued amateur radio in the post '68 decline of the service brought on by Incentive Licensing. At least in the clubs I frequent, I find a large number of active amateurs who are excited about the prospects of new technologies and who welcome *anyone* who shares their interests. Naturally I don't frequent those mortibund clubs that spend all their time arguing about increasing the CW IDer's speed on their tube type repeater, or who endlessly haggle about Robert's Rules of Order. One of my favorite groups specifically eschews Robert in our charter, and we don't charge dues. We find that passing the hat when we need to do something works very well. We don't have a President either, preferring a Lord of Chaos as our leader.

4794. Re: The comming no-code newbies... What has the FCC done to us this time?

Newsgroup: rec.ham-radio
Date: 1990-12-31 17:57:16 UTC
From: olson@bootsie.UUCP
Message-ID: <54@bootsie.UUCP>
Source record: 4915

Excuses for posting: I have a feeling there are a lot of hams-to-be reading rec-ham.radio these days; I'm not flaming; There's a question at the end of this reply.

In a recent article chguest@pioneer.arc.nasa.gov (Charles J. Guest) writes:
>A) I have been away from the ham side of things for so long that I am
>even in a quandry as to what to look for as far as books on the subject.
>I suspect that ARRL still puts out quite a library, but I am more
>interested in something to help get the license that is less stilted in
>the ways (and pockets) of the ARRL.
>...

Radio Shack sells Novice, Technician, and General class study guides. (They also actually still sell a Ham radio! Boy was I suprised about that! [10m mobile-- you can't operate it as a no-code tech :-( ]). They list for $19.95, $4.95, and $19.95, respectively (the higher priced ones come with code cassettes). The ARRL book "Tune in the World" book alone is $14, $19 with code cassettes. The Tech manual is $6. For my money, I'd rather support a group of friendly technically oriented people than rude idiot salemen. If you really want to save money, sign the ARRL books out of your local library (but get the most recent ones you can find-- I've found some pretty out-of-date info!). Note: I was suprised that the ARRL Handbook doesn't contain any study guides (but just about everything else). That's the book most likely for your library to have.

>C) One of the big draws, asside from helping others, to the ham hobby
>was the ability to talk across the country and overseas. Since this is
>not going to be possible for me on the HF bands, have there been any
>developments in the last ten years that could be of interest to me in
>this regard?

I'm told that there are networks of 2m->10m repeaters that will let you DX from a Handheld (albeit a limited choice of frequencies). If this is incorrect, I'm sure someone will chime in. A lot of the activity in Ham radio of late seems to be aimed at reducing the amount of equipment you need to be a well-connected Ham (for instance, I believe there are various gateways coming online between different types of packet radio).

>D) Keeping a budget in mind, if you had to start all over again buying
>new equipment for your shack what would you consider buying.

I don't own much equipment yet (I'm not licensed either), but I will probably look for it at Ham Swapfests. I think they are listed in

QST (a good reason for joining the AARL). Ham equipment is pretty
inexpensive used (unfortunately, the best price/performance bargain
is all old 10m equipment-- I've a few offers for _free_ stuff like
that, which is one reason I'm tempted to go for the coded tech license).
A problem for me is knowing what a Whizbang TQ-500 All band _is_!
Another good reason to get QST...

Along these lines, are there any used-ham-equipment catalog publications?

Cheers!

-Eric

>NOTHING ! ?

Actually, there's a simple explanation for having heard nothing: so far we've only listened to a tiny fraction of the search space (duration, frequency, spatial direction) with enough sensitivity to detect other earth-like civilizations. We have a lot more listening to do before we can conclude there are no other earth-like civilizations within X light-years. There are some major projects gearing up to do just that. They're considerably cheaper than a "billion dollars", however; a real bargain by NASA manned space flight project standards.

Phil

4796. Re: HTs and Die Hard

>Does anyone know which model(s) HT(s) were used in the movies Die Hard 1 and
>2? And, what can you tell me about their performance and price?

I have no idea what they were, but you can be assured that any real HT you find won't work like those did. The scriptwriter obviously didn't have the slightest idea how a personal communication device works in the real world.

The HTs were pretty obviously half-duplex devices (they had a PTT switch), and yet people were able to break in while someone else was transmitting. Other people could "hang-up" on you (huh?). And his call to police dispatch was a little outrageous.

I know you knew all that. :) The devices they used in the movie may have been built by the prop department.

It's because they're trying to talk to us on 60 Hz.

Just kidding. :-) (60 Hz doesn't get through the atmosphere, does it?)

>several wavelengths long at broadcast AM frequencies could begin to be
>a mile in length.

The Beverage is primarily used as a receiving antenna. It suffers heavy
ground losses as a transmit antenna and requires large non-inductive
resistors for it's termination if used in transmit service. Many 160
meter operators use a vertical for transmiting and multiple Beverages
for receiving.

>The all time best AM broadcast band DX antenna would be an active loop
>antenna located some distance from the house, electrical wires, etc.
>The loop would of course be remotely rotatable. The gain of this setup
>would be such that the baseline atmospheric noise it picked up on the
>quietest night would just override the receiver's internal noise. The
>long antenna you propose would tend to cause a receiver dynamic range
>problem without any real DX benefit.

The major advantage of the Beverage over the loop is that the Beverage
has a very narrow angle of acceptance while the loop receives over a
nearly 360 azimuth with a narrow, but very sharp, bidirectional null.
The Beverage, on the other hand, is truely unidirectional with a major
lobe of about 15 degrees for an eight wavelength model. This means that
it strongly rejects signals and atmospheric noise from nearly 345 degrees
of the compass. This results in a very quiet antenna that can separate
two stations operating on the same frequency if they are more than 15
degrees apart at your location. This is very useful for Broadcast Band
DX.

The major disadvantage of the Beverage is physical size. You really need
access to 300+ acres of property to properly install a system with one

Beverage wire every 15 degrees. If your house is back in the woods, this is not generally a problem except at timber harvesting time.

4801. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-12-31 18:24:50 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9012311824.AA22618@blackbird.afit.af.mil>
Source record: 4904

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

We are indeed proud of our relationship with AMSAT-I in general but with
Alberto Zagni, I2KBD, and his crew in Milano. They have taken Microsat
schematics, mechanical drawing, and without much help, have constructed
an operational Microsat. So proud are we of them, that we have made his
group operators on PACSAT, the microsat run by AMSAT-NA. A truly fine
new satellite building group is being formed in Milano and I am extremely
proud of them.

>

Good riddance. This was a ripoff (err uhh I meant `copy') of UOSAT-2.
They insisted on operating the thing in the low end of 2 meters (in
the 2 meter EME band) and would never tell anyone anything. This had
very very litte to do with amateur radio. It was a terrible misuse

of amateur radio frequencies. I happy the Pakistani's successfully launched their first satellite but I am deeply distressed that it went into service in the amateur radio bands and did not operate in the amateur satellite service.

> John A. Magliacane

Thanks John for publishing this news. It is a nice service.

>
> Gary KE4ZV

I have a TS-790A and I use it only as an IF for my S band gear. I took it
out of satellite service within one week of putting it on the air and
went back to using my IC-271 and IC-471. Satellite operation was
strictly an add on option at the last minute and without input from
a satellite user is what I fear happened. After DOVE gets reloaded,
I am going to do something else about a 2 meter IF for DOVE since the
thing is not suitable in any way for data. I hope some day the JA
rig companies will realize that 50000 plus tnc owners (at least) need
support as well.

> 73 de Jim Grubs, W8GRT
>

Even dumber now Jim. Please see the latest ARRL bulletins. The FCC gave
them no time to react. It is a fait accompli. The commission ordered
it into effect on February 14. No appeals allowed. If the ARRL wants
to waste money on another lawsuit, possibly they can do something. It
is really time to put this decision into our pipe and smoke it. It can be
a success or failure or simply a ripple into amateur radio's not so
long decent into senility. We have been given a recruiting tool. I
suggest that we go out and make use of it. If you do not like the nocode
tech, then recruit your people from those to whom learning the code is
not a deterrent into getting into amateur radio. It seems that Jim and
I (and many others) have found potentially valuable recruits for whom the
morse code requirement was sufficiently daunting to force refusal of
amateur radio as a hobby. We must make amateur radio relevant to the
21-st century US citizens now, or there will not be such a hobby then.
(I only talk about relevance to US citizens since this is an FCC action
and not a UN one ;-).

>reccomend anything else that might be helpfull?

The League stuff still gives you the broadest *understanding* of the topics you need to know. There are several Q&A books out there that you can find at many ham stores. They are sufficient to pass the exam. But don't shortchange yourself, get a general reference and absorb some material. It will prove useful later on.

>B) My wife and I have talked about her geting into this in a lesser way,

She may work in tandem with you as long as you supervise all transmissions. This is considered third party operation and some restrictions apply, but none that should bother you at VHF+. She may not use amateur radio unsupervised in order to contact you. She may use *any* radio equipment in a true emergency where there is an immediate threat to life or property and no other means of communications is available. This is a rather rare occurrence intended mostly for shipboard disasters where there is absolutely no other way of signalling for help.

>C) One of the big draws, asside from helping others, to the ham hobby

>this regard? I understand that there is some sattelite stuff open to ham
>operators, and I am currious about what it might cost to set up a shack
>for transmission and reception in that area as well as anything else.

Well there are satellites and there are satellites. Some satellites
support SSB voice and *ahem* CW communications. The rest are for use
by packet radio. A from scratch SSB satellite station will realistically
cost well over $1000, more like $2000 if purchased new. A satellite
capable packet station can be cheaper in the RF department, but you
must add in the computer and TNC. So you're still looking at a couple
of grand for a from scratch setup. On the other hand, if you already
have a HF radio, you can put together a satellite CW station for about
$200 and a little scrounging. Of course, if you could do CW, you could
just use the HF rig.

>D) Keeping a budget in mind, if you had to start all over again buying
>new equipment for your shack what would you consider buying. I am
>interested in handhelds as well as base station style goodies. I will
>not be installing mobile rigs in our vehicles sans the handhelds on the
>next seat. :-) (Give me a starting place here folks...)

A first cabin Tech station would have an Icom 970 equipped for all mode
2 meter,70 cm,and 33 cm and 100 watt amplifiers for each band. Add in
a set of circularly polarized yagis on an AZ-EL mount and you would be
equipped to do all the popular modes including satellite. A budget operation
that gives FM only capability would be an Alinco 570T. This would give
you medium power on both 2 meter and 70 cm FM. My personal favorite
handheld is the popular Yaesu FT470 dual bander. For the real cost
cutters, I'd find a used Icom 2AT at a hamfest for two meter handheld,
and would look for any of the medium power used 2 meter rigs such as
the IC28H for my base or mobile installation. In general a mobile rig
run off of a separate power supply is a very good choice for home use.
Most AC operated VHF/UHF equipment will be all mode and much more
expensive.

> and would probably be an attractive option for a lot of the people
> lured in by the promise of no-code (e.g., those that like a challenge
> but don't like to _fail_ :-).

I don't see a reason why not. When I took my tests the first time,
I asked to take the whole sheebang, but I flunked 1c (20 wpm) after
passing the written exams. The grand OM giving the code tests simply
kept me seated and played the 1b (13 wpm) tape to me. They then
submitted the Form 610 for an advanced license.

I am sure they will do the same come February for those who passes
Elements 2 and 3a, tries 1a but flunks it.

For those of you edgy and nervous about the tests, don't be. The
Volunteer Examiners couldn't be a friendlier bunch of folks who
wants to find every legitimate reason to *pass* you. After
flunking the 20 wpm 10-questions test, the examiner plowed over
and over through my illegible handwriting to try hard as heck to
see if I had 1-minute solid-copy. At least, that was my experience
with the ARRL VEC in Cupertino here. Absolutely super people.
(See? I don't *always* bash the League. :-)

So did I, remember? That still doesn't justify the disgusting jokes about
druggies and being dropped on the head.

> The real answer is: It's true that -maybe- some handicapped persons
> can't pass
> the code test because of some physical failing.

Maybe? What about dyslexics who can't tell the difference between dots and
dashes no matter how they are transmitted - sound, light, vibrations, etc.

> And the whole thing started because Pres. Bush got a bug up his ass and
> sent
> a memo to FCC.

Bush got bugged because it took a Arab king to make him aware of the
insensitivity of his own administration.

> What credentials does the average MD or DO have for deciding whether you
> or I
> can't pass the CW test "because of ***"?

Depends on how well they have the problem explained to them, I guess. If you
tell a neurologist you're having trouble telling the difference between short
tones and long tones, he'd probably be able to handle that. If you tell him
you can't tell the difference between .-.. and ..-. he'd understand that.

> I will repeat: it's a farce. Is your muscular distrophy
> limiting you

> more than Frank Spicer's blindness/deafness? Or maybe K3KTH. I haven't

Ding bust it, we're not talking about sensory or motor handicaps. We're talking about neurological handicaps that make PERCEPTION and INTERPRETATION of sensory input difficult or impossible.

> Incidentally, about the no-code: It's an elegant solution; it should
> work.

Well, there I agree with you. Elegant is the word.

In article <54@bootsie.UUCP> I wrote:
>I'm told that there are networks of 2m->10m repeaters that will let
>you DX from a Handheld (albeit a limited choice of frequencies). If
>this is incorrect, I'm sure someone will chime in.

I got real curious about this, since I got mixed replies. So I called
the ARRL, and Tom Hogerty, KC1J, kindly informed me that the general
rule is that you _may_ operate a repeater that outputs on frequencies
for which you are not licensed (he mentioned something I did not fully
understand about not being allowed to _change_ the repeater output to
a band for which you aren't licensed, which makes sense, but specifically
said that if the repeater is already set up, it's OK). So this is
a valid and legal way for the new no-code techs to get a taste of DX!

Cheers!

Tad...The following was posted in rec.ham-radio on Dec 21. It references a ARRL Press Release. Price's comments along the line that Jim references follow in the last two paragraphs.

ARRL/VEC NEWS RELEASE December 14, 1990

To: All ARRL VE Team Liaisons

From: Bart J. Jahnke. KB9NM. ARRL/VEC Manager

FOR IMMEDIATE RELEASE

FCC CREATES CODELESS CLASS OF AMATEUR RADIO LICENSE

For the first time ever, starting in February it will be possible to obtain an Amateur Radio license in the United States without passing a Morse code test. This was announced by the FCC at its open meeting yesterday, December 13th. The Federal Communications Commissions (FCC) has eliminated the need for new Technician class Amateur Radio license applicants to demonstrate proficiency in Morse code in order to have all amateur privileges above 30 MHz. The implementation date may be as early as February 1991. Technicians who obtain their licenses prior to that date will be grandfathered, meaning their existing HF privileges will continue.

The codeless Technician written examination will have 55 questions (existing Elements 2 and 3A). New Technicians wishing to gain access to the HF privileges below 30 MHz will be required to pass the Element 1A (5 WPM) Morse code test before three Volunteer Examiners accredited by Volunteer Examiner Coordinators, and will be given a Certificate of Successful Completion of Examination (CSCE) to serve as evidence of their qualifications. That CSCE must be retained by them in perpetuity to prove they have met the requirement to gain access to the Novice HF bands. Novices wishing to upgrade to Technician must pass Element 3A to gain the VHF privileges of the Technician class. Novices will need to retain a copy (preferably the original) of their Novice license in order to show that they have met the 5 WPM requirment for HF band access. This is because there will be no call sign designator to indicate Technicians who have or have not passed a code test. VECs will supply the FCC with a list of those codeless Technicians who passed element 1A.

There has been no change to the Novice license in any way, nor has there been any change made above the Technician class. Novice examinations will continue to be available both by two Novice examiners (no test fee), or by three accredited VEs (no test fee if only elements 1A and 2 are involved). The FCC decided to retain the current Novice Class operator license as an alternate entry level license for those persons able to pass the 5 WPM Morse code test instead of the more comprehensive written exam required for the Technician Class license.

At a press briefing held just after the Commission's meeting, FCC Private Radio Bureau Chief Ralph Haller said "The Amateur Service is not growing as it should relative to what it has to offer." He said that the Amateur Service is where our nation's technical expertise comes from--that the changes should attract people who are interested in computers and digital communications, and should help the US to become more competitive.

In a news release today, ARRL President Larry Price, W4RA noted with pleasure that the Commission had decided to retain the Novice license as a means of entry into Amateur Radio and to adopt a

codeless license with a meaningful written examination requirement. "Our members were very strong on both of these points, because they couldn't imagine how we could maintain the character of the Amateuer Radio Service without them," Mr. Price said.

Presiden Price sounded a note of caution with the privileges the Commission plans to grant codeless licesees. He indicated that the formula developed by the ARRL Board, which called for privileges above 220 MHz, was based upon extensive membership input. It was carefully balanced to offer attractive privileges while protecting existing patterns of amateur activity. While it will take some time to gauge the reaction to the Commission's action, Mr. Price observed that the FCC formula is likely to be less acceptable to many amateurs than the League's. He asks that League members share their views with their elected Directors, who will collectivly determine League policy.

"Before we can decide whether to request that the Commisson partially reconsider its action, we'll have to see the Report and Order," said Mr. Price. Usually it takes the FCC from several days to several weeks after a Commisson action to release an itemn after editorial review. There is a 30 day window of opportunity following release in which petitions for recondsideration can be filed. Mr. Price noted that ARRL Board was holding its regular meeting on January 18-19 1991. "The timing looks good for a careful review of the Commission's action at that meeting," he said.

Your response seems to me to be more of a flame that his was to you.

It also seems a bit of overreaction.

Hams have always had a tradition of helping others learn. I am indebted to
countless Elmers.

It could be that he was trying to help. "Help" does not need to be restricted
to technical items.

Perhaps some people only accept help when they ask for it and reject it
otherwise.

All you need is four horizontal pieces of wire, going out in different
directions, each of them as long as the antenna itself. This is a very
common configuration for commercial 2-way radio antennas.
